

MC68L300

Technical Supplement

16.78 MHz Electrical Characteristics

Devices in the M68300 Modular Microcontroller Family are built up from a selection of standard functional modules. The MC68331 and MC68332 contain the same central processing unit (CPU32) and system integration module (SIM), and thus have similar electrical characteristics.

M68300 devices that operate at 3.3 volts are now available. This publication contains electrical characteristics that supplement the *MC68331 User's Manual* (MC68331UM/AD) and the *MC68332 User's Manual* (MC68332UM/AD).

MC68L331 and MC68L332 are currently offered for operation in external clock mode only.

Enhanced versions of the MC68331 and MC68332 will offer extended V_{DD} operating range, PLL, 5 volt tolerant I/O, and higher frequency.

Table 1 Maximum Ratings

Num	Rating	Symbol	Value	Unit
1	Supply Voltage ^{1,2,3}	V_{DD}	– 0.3 to + 6.5	V
2	Input Voltage ^{1,2,3,4,5,7}	V_{IN}	– 0.3 to + 6.5	V
3	Instantaneous Maximum Current Single Pin Limit (all pins) ^{1,3,5,6}	I_D	25	mA
4	Operating Maximum Current Digital Input Disruptive Current ^{3,5,6,7,8} $V_{NEGCLAMP} \equiv -0.3\text{ V}$ $V_{POSCLAMP} \equiv V_{DD} + 0.3$	I_{id}	– 500 to 500	μA
5	Operating Temperature Range C Suffix	T_A	T_L to T_H – 40 to 85	$^{\circ}\text{C}$
6	Storage Temperature Range	T_{stg}	– 55 to 150	$^{\circ}\text{C}$

NOTES:

1. Permanent damage can occur if maximum ratings are exceeded. Exposure to voltages or currents in excess of recommended values affects device reliability. Device modules may not operate normally while being exposed to electrical extremes.
2. Although sections of the device contain circuitry to protect against damage from high static voltages or electrical fields, take normal precautions to avoid exposure to voltages higher than maximum-rated voltages.
3. This parameter is periodically sampled rather than 100% tested.
4. All pins except TSC.
5. Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.
6. Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current.
7. All functional non-supply pins are internally clamped to V_{SS} . All functional pins except EXTAL and XFC are internally clamped to V_{DD} .
8. Total input current for all digital input-only and all digital input/output pins must not exceed 10 mA. Exceeding this limit can cause disruption of normal operation.

Table 2 MC68L331 Typical Ratings

Num	Rating	Symbol	Value	Unit
1	Supply Voltage	V_{DD}	3.3	V
2	Operating Temperature	T_A	25	$^{\circ}\text{C}$
3	V_{DD} Supply Current RUN LPSTOP, External clock, max f_{sys}	I_{DD}	38 1.0	mA mA
4	Clock Synthesizer Operating Voltage	V_{DDSYN}	3.3	V
5	V_{DDSYN} Supply Current External Clock, maximum f_{sys}	I_{DDSYN}	1.5	mA
6	RAM Standby Current Normal RAM operation Standby operation	I_{SB}	3.0 10	μA μA
7	Power Dissipation	P_D	125.0	mW

Table 3 MC68L332 Typical Ratings

Num	Rating	Symbol	Value	Unit
1	Supply Voltage	V_{DD}	3.3	V
2	Operating Temperature	T_A	25	°C
3	V_{DD} Supply Current RUN LPSTOP, External clock, max f_{sys}	I_{DD}	45 1.0	mA mA
4	Clock Synthesizer Operating Voltage	V_{DDSYN}	3.3	V
5	V_{DDSYN} Supply Current External Clock, maximum f_{sys}	I_{DDSYN}	2.0	mA
6	RAM Standby Current Normal RAM operation Standby operation	I_{SB}	3.0 10	μA μA
7	Power Dissipation	P_D	148.0	mW

Table 4 Thermal Characteristics

Num	Rating	Symbol	Value	Unit
1	Thermal Resistance Plastic 132-Pin Surface Mount Plastic 144-Pin Surface Mount	Θ_{JA}	38 49	°C/W

The average chip-junction temperature (T_J) in C can be obtained from:

$$T_J = T_A + (P_D \times \Theta_{JA}) \quad (1)$$

where:

T_A = Ambient Temperature, °C

Θ_{JA} = Package Thermal Resistance, Junction-to-Ambient, °C/W

$P_D = P_{INT} + P_{I/O}$

$P_{INT} = I_{DD} \times V_{DD}$, Watts — Chip Internal Power

$P_{I/O}$ = Power Dissipation on Input and Output Pins — User Determined

For most applications $P_{I/O} < P_{INT}$ and can be neglected. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = K \div (T_J + 273^\circ\text{C}) \quad (2)$$

Solving equations 1 and 2 for K gives:

$$K = P_D \times (T_A + 273^\circ\text{C}) + \Theta_{JA} \times P_D^2 \quad (3)$$

where K is a constant pertaining to the particular part. K can be determined from equation (3) by measuring P_D (at equilibrium) for a known T_A . Using this value of K, the values of P_D and T_J can be obtained by solving equations (1) and (2) iteratively for any value of T_A .

Table 5 16.78 MHz DC Characteristics(V_{DD} and V_{DDSYN} = 3.0 to 3.6Vdc, V_{SS} = 0 Vdc, T_A = T_L to T_H)

NOTES:

1. Applies to:
QSM pins
 $\overline{\text{IRQ}}[7:1]$, $\overline{\text{RESET}}$, $\overline{\text{EXTAL}}$, $\overline{\text{TSC}}$, $\overline{\text{RMC}}$, $\overline{\text{BKPT/DSCLK}}$, $\overline{\text{IFETCH/DSI}}$
2. Input-Only Pins: $\overline{\text{TSC}}$, $\overline{\text{BKPT/DSCLK}}$, $\overline{\text{RXD}}$
Output-Only Pins: $\overline{\text{CSBOOT}}$, $\overline{\text{BG/CS}}$, $\overline{\text{CLKOUT}}$, $\overline{\text{FREEZE/QUOT}}$, $\overline{\text{IPIPE/DSO}}$
Input/Output Pins:
Group 1: $\text{DATA}[15:0]$, $\overline{\text{IFETCH/DSI}}$
Group 2: $\text{ADDR}[23:19]/\overline{\text{CS}}[10:6]$, $\text{FC}[2:0]/\overline{\text{CS}}[5:3]$, $\overline{\text{DSACK}}[1:0]$, $\overline{\text{AVEC}}$, $\overline{\text{RMC}}$, $\overline{\text{DS}}$, $\overline{\text{AS}}$, $\text{SIZ}[1:0]$
 $\overline{\text{IRQ}}[7:1]$, $\overline{\text{MODCLK}}$, $\text{ADDR}[18:0]$, $\text{R}/\overline{\text{W}}$, $\overline{\text{BERR}}$, $\overline{\text{BR/CS0}}$, $\overline{\text{BGACK/CS2}}$, $\text{PCS}[3:1]$, PCS0/SS , TXD
Group 3: $\overline{\text{HALT}}$, $\overline{\text{RESET}}$
Group 4: MISO , MOSI , SCK
3. Does not apply to $\overline{\text{HALT}}$ and $\overline{\text{RESET}}$ because they are open drain pins.
Does not apply to Port QS[7:0] (TXD , $\text{PCS}[3:1]$, PCS0/SS , SCK , MOSI , MISO) in wired-OR mode.
4. Current measured at maximum system clock frequency.
5. Total operating current is the sum of the appropriate V_{DD} supply and V_{DDSYN} supply current.
6. When V_{SB} is more than 0.3V greater than V_{DD} , current flows between the V_{STBY} and V_{DD} pins, which causes standby current to increase toward the maximum condition specification. System noise on the V_{DD} and V_{STBY} pin can contribute to this condition.
7. The SRAM module will not switch into standby mode as long as V_{SB} does not exceed V_{DD} by more than 0.5 volts. The SRAM array cannot be accessed while the module is in standby mode.
8. Power dissipation measured at specified system clock frequency. Power dissipation can be calculated using the expression:
$$P_D = 3.6V (I_{\text{DDSYN}} + I_{\text{DD}})$$
9. Input capacitance is periodically sampled rather than 100% tested.

77	RESET Assertion Time ¹⁰	t_{RSTA}	4	—	t_{cyc}
78	RESET Rise Time ^{11,12}	t_{RSTR}	—	10	t_{cyc}

NOTES:

1. All AC timing is shown with respect to 20% V_{DD} and 70% V_{DD} levels unless otherwise noted.
2. When an external clock is used, minimum high and low times are based on a 50% duty cycle. The minimum allowable t_{xcyc} period is reduced when the duty cycle of the external clock varies. The relationship between external clock input duty cycle and minimum t_{xcyc} is expressed:
Minimum t_{xcyc} period = minimum t_{xchl} / (50% – external clock input duty cycle tolerance).
3. Specification 9A is the worst-case skew between \overline{AS} and \overline{DS} or \overline{CS} . The amount of skew depends on the relative loading of these signals. When loads are kept within specified limits, skew will not cause \overline{AS} and \overline{DS} to fall outside the limits shown in specification 9.
4. If multiple chip selects are used, \overline{CS} width negated (specification 15) applies to the time from the negation of a heavily loaded chip select to the assertion of a lightly loaded chip select. The \overline{CS} width negated specification between multiple chip selects does not apply to chip selects being used for synchronous ECLK cycles.
5. Hold times are specified with respect to \overline{DS} or \overline{CS} on asynchronous reads and with respect to CLKOUT on fast cycle reads. The user is free to use either hold time.
6. Maximum value is equal to $(t_{cyc} / 2) + 25$ ns.
7. If the asynchronous setup time (specification 47A) requirements are satisfied, the $\overline{DSACK}[1:0]$ low to data setup time (specification 31) and $\overline{DSACK}[1:0]$ low to BERR low setup time (specification 48) can be ignored. The data must only satisfy the data-in to clock low setup time (specification 27) for the following clock cycle. BERR must satisfy only the late \overline{BERR} low to clock low setup time (specification 27A) for the following clock cycle.
8. To ensure coherency during every operand transfer, \overline{BG} is not asserted in response to \overline{BR} until after all cycles of the current operand transfer are complete.
9. In the absence of $\overline{DSACK}[1:0]$, \overline{BERR} is an asynchronous input using the asynchronous setup time (specification 47A).
10. After external \overline{RESET} negation is detected, a short transition period (approximately 2) t_{cyc} elapses, then the SIM drives \overline{RESET} low for 512 t_{cyc} .
11. External assertion of the \overline{RESET} input can overlap internally-generated resets. To insure that an external reset is recognized in all cases, \overline{RESET} must be asserted for at least 590 CLKOUT cycles.
12. External logic must pull \overline{RESET} high during this period in order for normal MCU operation to begin.

NOTES:

1. All AC timing is shown with respect to 20% V_{DD} and 70% V_{DD} levels unless otherwise noted.
2. When previous bus cycle is not an ECLK cycle, the address may be valid before ECLK goes low.
3. Address access time = $t_{Ecyc} - t_{EAD} - t_{EDSR}$.
4. Chip select access time = $t_{Ecyc} - t_{ECSD} - t_{EDSR}$.

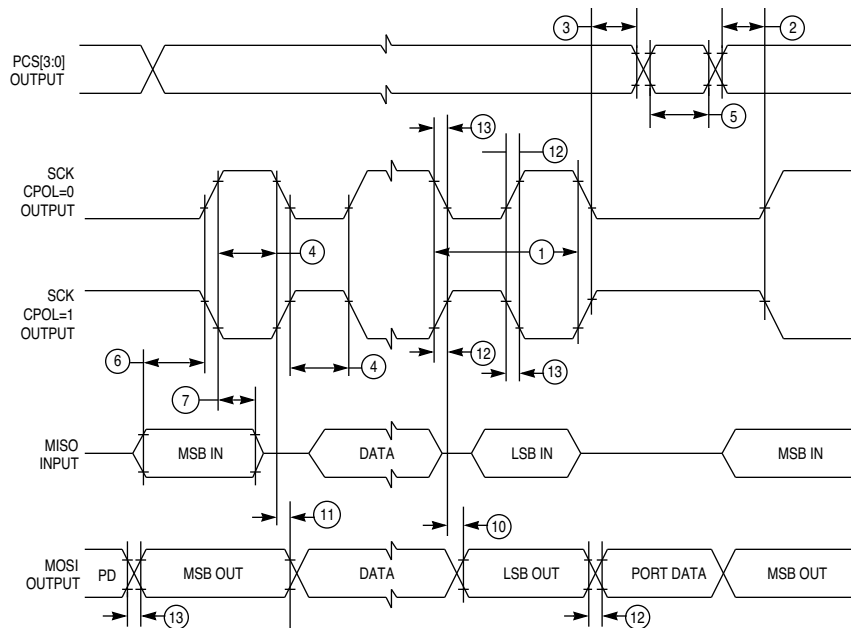

Figure 15 ECLK Timing Diagram

Table 9 QSPI Timing(V_{DD} and V_{DDSYN} = 3.0 to 3.6Vdc, V_{SS} = 0 Vdc, T_A = T_L to T_H, 100 pF load on all QSPI pins)¹

Num	Function	Symbol	Min	Max	Unit
1	Operating Frequency Master Slave	f _{op}	DC DC	1/4 1/4	f _{sys} f _{sys}
2	Cycle Time Master Slave	t _{qcy}	4 4	510 —	t _{cyc} t _{cyc}
3	Enable Lead Time Master Slave	t _{lead}	2 2	128 —	t _{cyc} t _{cyc}
4	Enable Lag Time Master Slave	t _{lag}	— 2	1/2 —	SCK t _{cyc}
5	Clock (SCK) High or Low Time Master Slave ²	t _{sw}	2 t _{cyc} – 60 2 t _{cyc} – n	255 t _{cyc} —	ns ns
6	Sequential Transfer Delay Master Slave (Does Not Require Deselect)	t _{td}	17 13	8192 —	t _{cyc} t _{cyc}
7	Data Setup Time (Inputs) Master Slave	t _{su}	30 20	— —	ns ns
8	Data Hold Time (Inputs) Master Slave	t _{hi}	0 20	— —	ns ns
9	Slave Access Time	t _a	—	1	t _{cyc}
10	Slave MISO Disable Time	t _{dis}	—	2	t _{cyc}
11	Data Valid (after SCK Edge) Master Slave	t _v	— —	50 50	ns ns
12	Data Hold Time (Outputs) Master Slave	t _{ho}	0 0	— —	ns ns
13	Rise Time Input Output	t _{ri} t _{ro}	— —	2 30	μs ns
14	Fall Time Input Output	t _{fi} t _{fo}	— —	2 30	μs ns

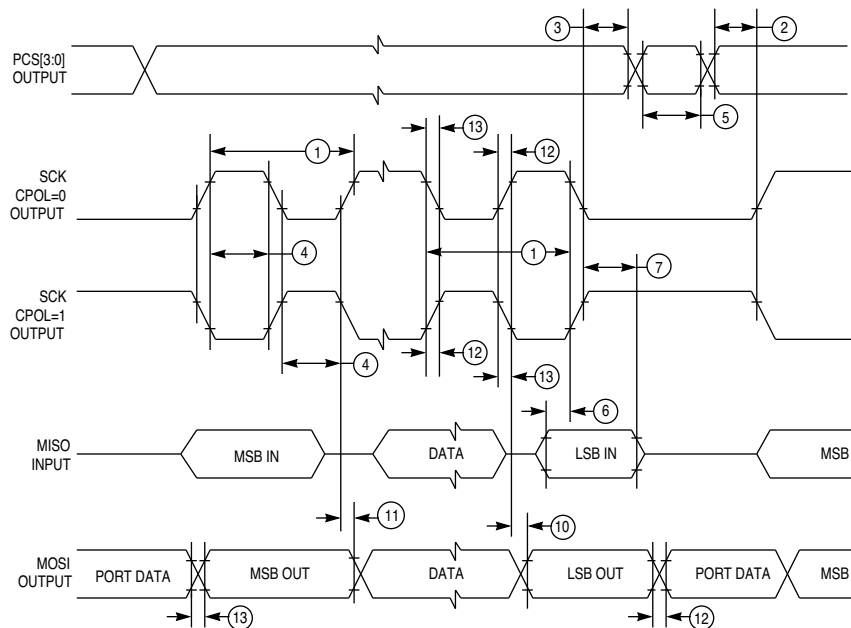

NOTES:

1. All AC timing is shown with respect to 20% V_{DD} and 70% V_{DD} levels unless otherwise noted.
2. For high time, n = External SCK rise time; for low time, n = External SCK fall time.

Table 10 Time Processor Unit Timing

(V_{DD} and $V_{DDA} = 3.0$ to 3.6 Vdc, $V_{SS} = 0$ Vdc, $T_A = T_L$ to T_H)¹

Num	Parameter	Symbol	Min	Max	Unit
1	CLKOUT High to TPU Output Channel Valid ^{2, 3, 4}	t_{CHTOV}	2	23	ns
2	CLKOUT High to TPU Output Channel Hold	t_{CHTOH}	0	20	ns
3	TPU Input Channel Pulse Width	t_{TIPW}	4	—	t_{cyc}

NOTES:

1. AC Timing is shown with respect to 20% V_{DD} and 70% V_{DD} levels.
2. Timing not valid for external T2CLK input.
3. Maximum load capacitance for CLKOUT pin is 90 pF.
4. Maximum load capacitance for TPU output pins is 100 pF.

TPU I/O TIM

Figure 20 TPU Timing Diagram

Table 11 General-Purpose Timer AC Characteristics

Num	Parameter	Symbol	Min	Max	Unit
1	Operating Frequency	Fclock	0	16.77	MHz
2	PCLK Frequency	Fpclk	0	1/4 Fclock	MHz
3	Pulse Width Input Capture	PWtim	2/Fclock	—	—
4	PWM Resolution	—	2/Fclock	—	—
5	IC/OC Resolution	—	4/Fclock	—	—
6	PCLK Width (PWM)	—	4/Fclock	—	—
7	PCLK Width (IC/OC)	—	4/Fclock	—	—
8	PAI Pulse Width	—	2/Fclock	—	—

- NOTE: 1. A = Input signal after the synchronizer
 2. B = "A" after the digital filter
 3. *PHI1 is the same frequency as system clock; however, it does not have the same timing.

Figure 21 Input Signal Conditioner Timing

- NOTE: 1. A = PAI signal after the synchronizer
 2. B = "A" after the digital filter
 3. *PHI1 is the same frequency as system clock; however, it does not have the same timing.
 4. The external leading edge causes the pulse accumulator to increment and the PAIF flag to be set.
 5. The counter transition from \$FF to \$00 causes the PAOVF flag to be set.

Figure 22 Pulse Accumulator — Event Counting Mode (Leading Edge)

- NOTE: 1. A = PAI signal after the synchronizer
 2. B = "A" after the digital filter
 3. PHI1*/4 clocks PACNT when GT-PAIF is asserted.
 4. PAIF is asserted when PAI is negated.
 5. *PHI1 has the same frequency as the system clock; however, it does not have the same timing.

Figure 23 Pulse Accumulator — Gated Mode (Count While Pin High)

- NOTE: 1. TCNT counts as a result of PHI1*/4; PACNT counts when TCNT overflows from \$FFFF to \$0000 and the conditioned PAI signal is asserted.
 2. *PHI1 has the same frequency as the system clock; however, it does not have the same timing.

Figure 24 Pulse Accumulator — Using TOF as Gated Mode Clock

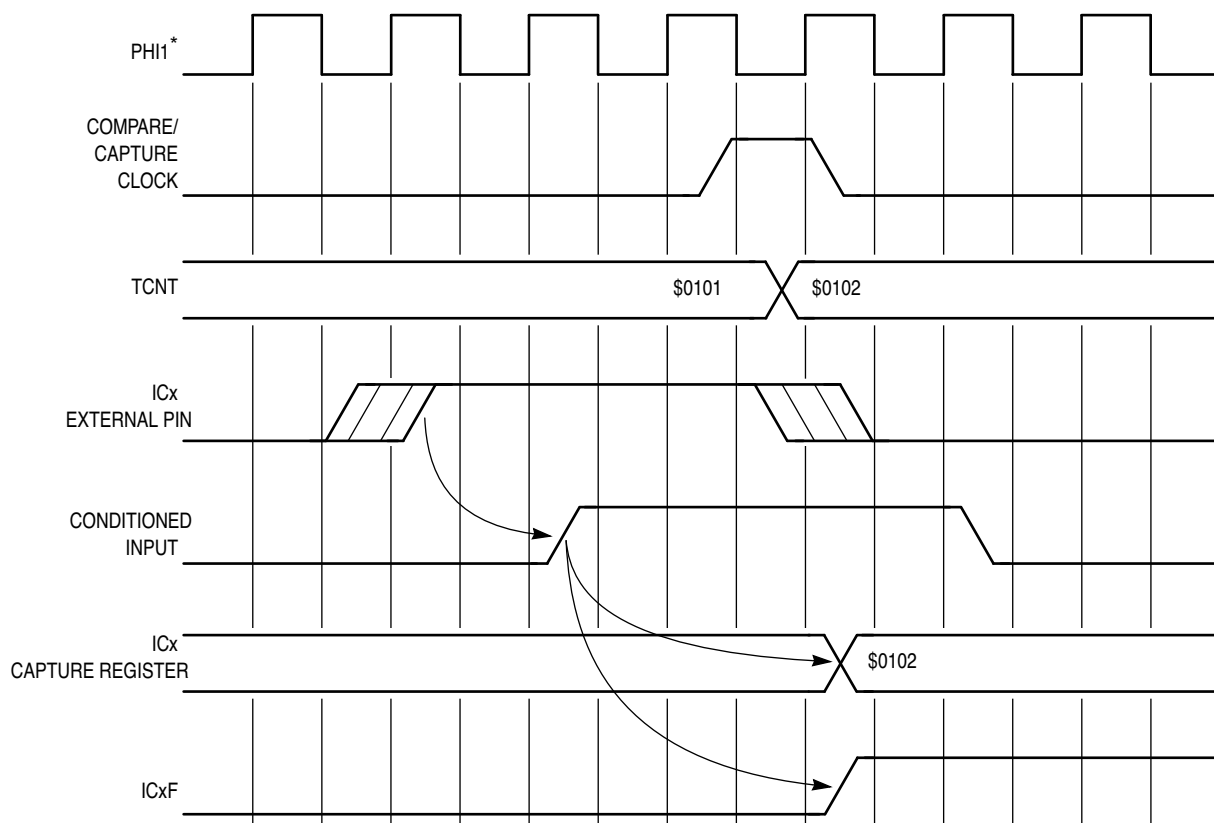

- NOTE: 1. *PAI1 is the same frequency as the system clock; however, it does not have the same timing.
 2. When the counter rolls over from \$FF to \$00, the PWM pin is set to logic level one.
 3. When the counter equals the PWM register, the PWM pin is cleared to a logic level zero.

Figure 25 PWMx (PWMx Register = 01, Fast Mode)

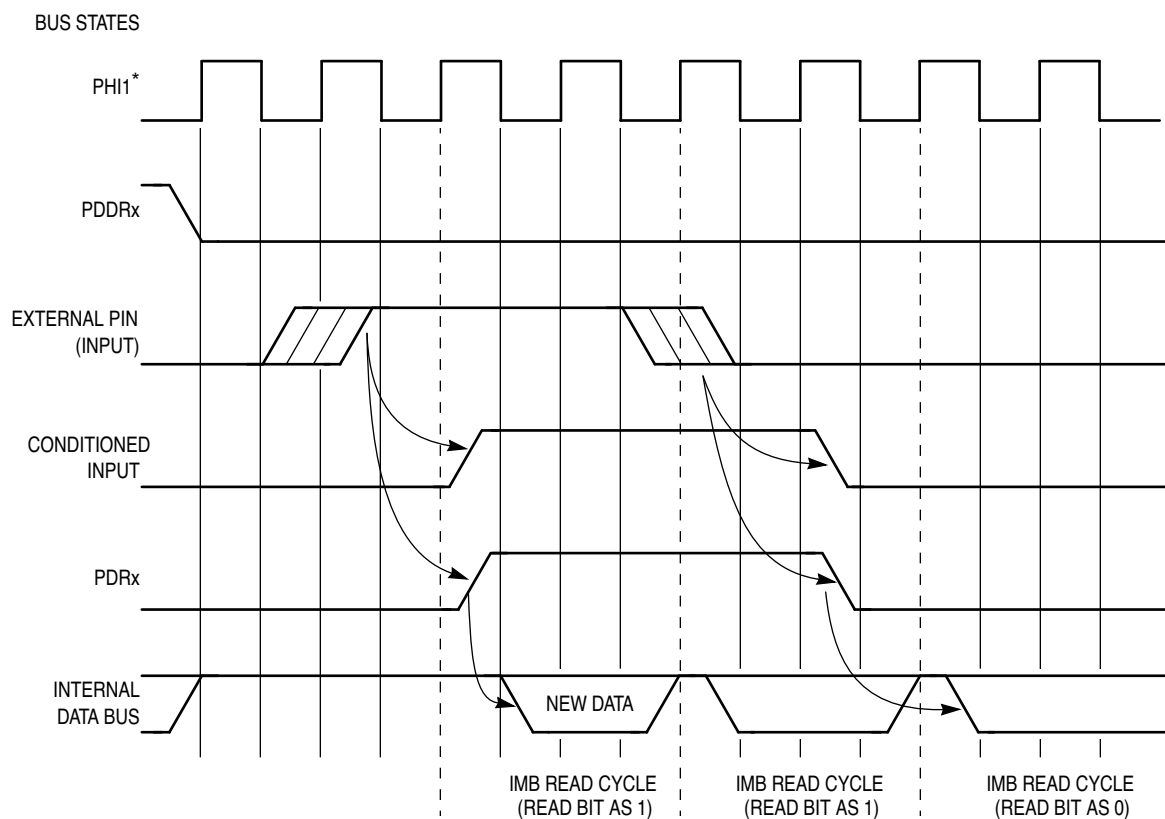

NOTE: 1. When the TCNT matches the OCx compare register, the OCxF flag is set followed by the OCx pin changing state.
 2. *PAI1 is the same frequency as the system clock; however, it does not have the same timing.

Figure 26 Output Compare (Toggle Pin State)

- NOTE: 1. The conditioned input signal causes the current value of the TCNT to be latched by the ICx capture register. The ICxF flag is set at the same time.
2. *PA11 is the same frequency as the system clock; however, it does not have the same timing.

Figure 27 Input Capture (Capture on Rising Edge)

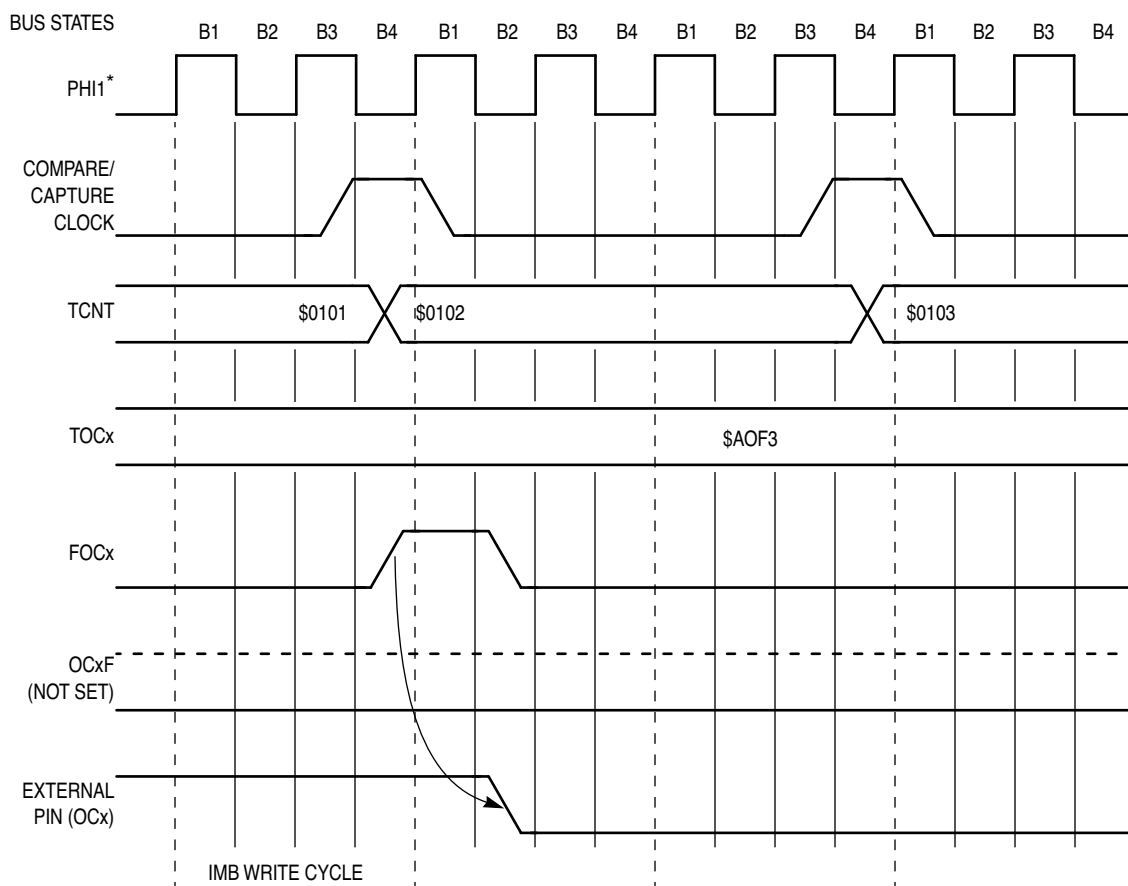

NOTE: 1. *PAI1 is the same frequency as the system clock; however, it does not have the same timing.

Figure 28 General-Purpose Input

- NOTE: 1. *PAI1 is the same frequency as the system clock; however, it does not have the same timing.
 2. When the bit value is driven on the pin, the input circuit sees the signal. After it is conditioned it causes the contents of the TCNT to be latched into the ICx compare register.

Figure 29 General-Purpose Output (Causes Input Capture)

NOTE: 1. *PAI1 is the same frequency as the system clock; however, it does not have the same timing.
