

# TLC2933 HIGH-PERFORMANCE PHASE-LOCKED LOOP

SLAS136A – APRIL 1996 – REVISED JUNE 1997

- **Voltage-Controlled Oscillator (VCO) Section:**
  - Ring Oscillator Using Only One External Bias Resistor ( $R_{BIAS}$ )
  - Lock Frequency:
    - 43 MHz to 100 MHz ( $V_{DD} = 5\text{ V} \pm 5\%$ ,  $T_A = -20^\circ\text{C}$  to  $75^\circ\text{C}$ ,  $\times 1$  Output)
    - 37 MHz to 55 MHz ( $V_{DD} = 3\text{ V} \pm 5\%$ ,  $T_A = -20^\circ\text{C}$  to  $75^\circ\text{C}$ )
- **Phase-Frequency Detector (PFD) Section Includes a High-Speed Edge-Triggered Detector With Internal Charge Pump**
- **Independent VCO, PFD Power-Down Mode**
- **Thin Small-Outline Package (14 terminal)**
- **CMOS Technology**
- **Typical Applications:**
  - Frequency Synthesis
  - Modulation/Demodulation
  - Fractional Frequency Division
- **CMOS Input Logic Level**

† Available in tape and reel only and ordered as the TLC2933PWLE.

NC – No internal connection

## description

The TLC2933 is designed for phase-locked-loop (PLL) systems and is composed of a voltage-controlled oscillator (VCO) and an edge-triggered-type phase frequency detector (PFD). The oscillation frequency range of the VCO is set by an external bias resistor ( $R_{BIAS}$ ). The high-speed PFD with internal charge pump detects the phase difference between the reference frequency input and signal frequency input from the external counter. Both the VCO and the PFD have inhibit functions that can be used as a power-down mode. With the high-speed and stable VCO characteristics, the TLC2933 is well suited for use in high-performance PLL systems.

## HIGH-PERFORMANCE PHASE-LOCKED LOOP

SLAS136A – APRIL 1996 – REVISED JUNE 1997

### Terminal Functions

TERMINAL NAME	NO.	I/O	DESCRIPTION
BIAS	13	I	Bias supply. An external resistor ( $R_{BIAS}$ ) between VCO $V_{DD}$ and BIAS supplies bias for adjusting the oscillation frequency range.
FIN–A	4	I	Input reference frequency $f_{(REF IN)}$ is applied to FIN–A.
FIN–B	5	I	Input for VCO external counter output frequency $f_{(FIN-B)}$ . FIN–B is nominally provided from the external counter.
LOGIC GND	7		Ground for the internal logic.
LOGIC $V_{DD}$	1		Power supply for the internal logic. This power supply should be separate from VCO $V_{DD}$ to reduce cross-coupling between supplies.
NC	8		No internal connection.
PFD INHIBIT	9	I	PFD inhibit control. When PFD INHIBIT is high, PFD OUT is in the high-impedance state, see Table 2.
PFD OUT	6	O	PFD output. When the PFD INHIBIT is high, PFD OUT is in the high-impedance state.
TEST	2	I	Test terminal. TEST connects to ground for normal operation.
VCO GND	11		Ground for VCO.
VCO IN	12	I	VCO control voltage input. Nominally the external loop filter output connects to VCO IN to control VCO oscillation frequency.
VCO INHIBIT	10	I	VCO inhibit control. When VCO INHIBIT is high, VCO OUT is low (see Table 1).
VCO OUT	3	O	VCO output. When VCO INHIBIT is high, VCO OUT is low.
VCO $V_{DD}$	14		Power supply for VCO. This power supply should be separated from LOGIC $V_{DD}$ to reduce cross-coupling between supplies.

### detailed description

#### VCO oscillation frequency

The VCO oscillation frequency is determined by an external resistor ( $R_{BIAS}$ ) connected between the VCO  $V_{DD}$  and the BIAS terminals. The oscillation frequency and range depends on this resistor value. While all resistor values within the specified range result in excellent low temperature coefficients, the bias resistor value for the minimum temperature coefficient is nominally 2.2 k $\Omega$  with 3-V  $V_{DD}$  and nominally 2.4 k $\Omega$  with 5-V  $V_{DD}$ . For the lock frequency range refer to the recommended operating conditions. Figure 1 shows the typical frequency variation and VCO control voltage.

Figure 1. VCO Oscillation Frequency

**VCO inhibit function**

The VCO has an externally controlled inhibit function which inhibits the VCO output. A high level on the VCO INHIBIT terminal stops the VCO oscillation and powers down the VCO. The output maintains a low level during the power-down mode as shown in Table 1.

**Table 1. VCO Inhibit Function**

VCO INHIBIT	VCO OSCILLATOR	VCO OUT	I <sub>DD</sub> (VCO)
Low	Active	Active	Normal
High	Stopped	Low level	Power Down

**PFD operation**

The PFD is a high-speed, edge-triggered detector with an internal charge pump. The PFD detects the phase difference between two frequency inputs supplied to FIN-A and FIN-B as shown in Figure 2. Nominally the reference is supplied to FIN-A, and the frequency from the external counter output is fed to FIN-B. For clock recovery PLL systems, other types of phase detectors should be used.

**Figure 2. PFD Function Timing Chart**

**PFD inhibit control**

A high level on the PFD INHIBIT terminal places PFD OUT in the high-impedance state and the PFD stops phase detection as shown in Table 2. A high level on the PFD INHIBIT terminal can also be used as the power-down mode for the PFD.

**Table 2. VCO Output Control Function**

PFD INHIBIT	DETECTION	PFD OUT	I <sub>DD</sub> (PFD)
Low	Active	Active	Normal
High	Stopped	Hi-Z	Power Down

## schematics

### VCO block schematic

### PFD block schematic

## absolute maximum ratings†

Supply voltage (each supply), V <sub>DD</sub> (see Note 1)	7 V
Input voltage range (each input), V <sub>I</sub> (see Note 1)	-0.3 V to V <sub>DD</sub> + 0.3 V
Input current (each input), I <sub>I</sub>	±20 mA
Output current (each output), I <sub>O</sub>	±20 mA
Continuous total power dissipation at (or below) T <sub>A</sub> = 25°C (see Note 2)	700 mW
Operating free-air temperature range, T <sub>A</sub>	-20°C to 75°C
Storage temperature range, T <sub>stg</sub>	-65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	260°C

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. All voltage values are with respect to network ground terminal.  
2. For operation above 25°C free-air temperature, derate linearly at the rate of 5.6 mW/°C.

# TLC2933 HIGH-PERFORMANCE PHASE-LOCKED LOOP

SLAS136A – APRIL 1996 – REVISED JUNE 1997

## recommended operating conditions

		MIN	NOM	MAX	UNIT
Supply voltage, $V_{DD}$ (each supply, see Note 3)	$V_{DD} = 3\text{ V}$	2.85	3	3.15	V
	$V_{DD} = 5\text{ V}$	4.75	5	5.25	
Input voltage, $V_I$ (inputs except VCO IN)		0		$V_{DD}$	V
Output current, $I_O$ (each output)		0		$\pm 2$	mA
VCO control voltage at VCO IN		1		$V_{DD}$	V
Lock frequency	$V_{DD} = 3\text{ V}$	37		55	MHz
	$V_{DD} = 5\text{ V}$	43		100	
Bias resistor, $R_{BIAS}$	$V_{DD} = 3\text{ V}$	1.8		2.7	k $\Omega$
	$V_{DD} = 5\text{ V}$	2.2		3	

NOTE 3: It is recommended that the logic supply terminal (LOGIC  $V_{DD}$ ) and the VCO supply terminal (VCO  $V_{DD}$ ) be at the same voltage and separated from each other.

## electrical characteristics over recommended operating free-air temperature range, $V_{DD} = 3\text{ V}$ (unless otherwise noted)

### VCO section

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{OH}$	High-level output voltage	$I_{OH} = -2\text{ mA}$	2.4			V

Figure 13

# TLC2933 HIGH-PERFORMANCE PHASE-LOCKED LOOP

SLAS136A – APRIL 1996 – REVISED JUNE 1997

## TYPICAL CHARACTERISTICS

APPLICATION INFORMATION

gain of VCO and PFD

Figure 16 is a block diagram of the PLL. The divider N value depends on the input frequency and the desired VCO output frequency according to the system application requirements. The  $K_p$  and  $K_V$  values are obtained from the operating characteristics of the device as shown in Figure 16.  $K_p$  is defined from the phase detector  $V_{OL}$  and  $V_{OH}$  specifications and the equation shown in Figure 16(b).  $K_V$  is defined from Figures 8, 9, 10, and 11 as shown in Figure 16(c).

The parameters for the block diagram with the units are as follows:

- $K_V$  : VCO gain (rad/s/V)
- $K_p$  : PFD gain (V/rad)
- $K_f$  : LPF gain (V/V)
- $K_N$  : countdown divider gain (1/N)

external counter

When a large N counter is required by the application, there is a possibility that the PLL response becomes slow due to the counter response delay time. In the case of a high frequency application, the counter delay time should be accounted for in the overall PLL design.

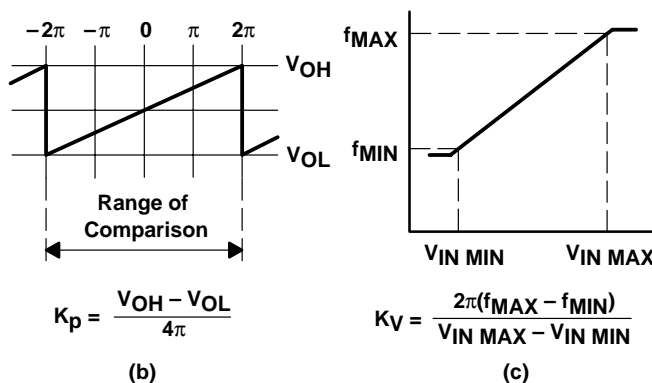

Figure 16. Example of a PLL Block Diagram

R<sub>BIAS</sub>

The external bias resistor sets the VCO center frequency with 1/2  $V_{DD}$  applied to the VCO IN terminal. For the most accurate results, a metal-film resistor is the better choice but a carbon-composition resistor can also be used with excellent results. A 0.22  $\mu$ F capacitor should be connected from the BIAS terminal to ground as close to the device terminals as possible.

hold-in range

From the technical literature, the maximum hold-in range for an input frequency step for the three types of filter configurations shown in Figure 17 is as follows:

$$\Delta\omega_H \approx 0.8 (K_p) (K_V) (K_f(\infty)) \tag{1}$$

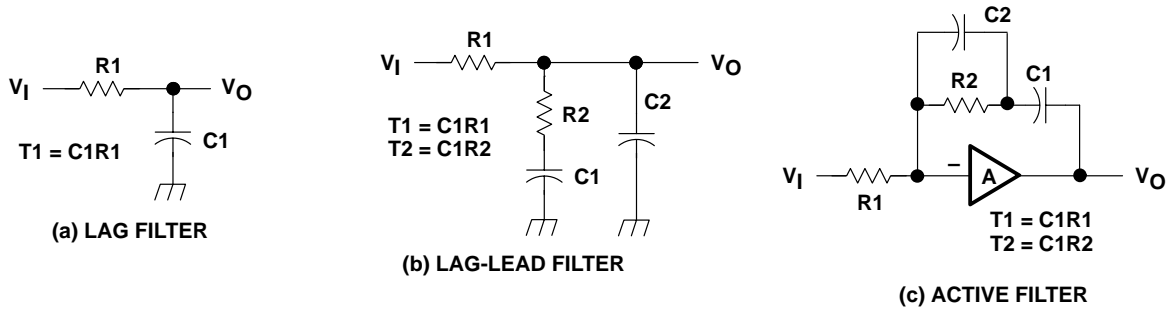

Where

$K_f(\infty)$  = the filter transfer function value at  $\omega = \infty$

**APPLICATION INFORMATION**

**low-pass-filter (LPF) configurations**

Many excellent references are available that include detailed design information about LPFs and should be consulted for additional information. Lag-lead filters or active filters are often used. Examples of LPFs are shown in Figure 17. When the active filter of Figure 17(c) is used, the reference should be applied to FIN-B because of the amplifier inversion. Also, in practical filter implementations, C2 is used as additional filtering at the VCO input. The value of C2 should be equal to or less than one tenth the value of C1.

**Figure 17. LPF Examples for PLL**

**the passive filter**

The transfer function for the low-pass filter shown in Figure 17(b) is;

$$\frac{V_O}{V_{IN}} = \frac{1 + s \cdot T2}{1 + s \cdot (T1 + T2)} \tag{2}$$

where

$$T1 = R1 \cdot C1 \text{ and } T2 = R2 \cdot C1$$

Using this filter makes the closed-loop PLL system a type 1 second-order system. The response curves of this system to a unit step are shown in Figure 18.

**the active filter**

When using the active filter shown in Figure 17(c), the phase detector inputs must be reversed since the filter adds an additional inversion. Therefore, the input reference frequency should be applied to the FIN-B terminal and the output of the VCO divider should be applied to the input reference terminal, FIN-A.

The transfer function for the active filter shown in Figure 17(c) is:

$$F(s) = \frac{1 + s \cdot R2 \cdot C1}{s \cdot R1 \cdot C1} \tag{3}$$

Using this filter makes the closed-loop PLL system a type 2 second-order system. The response curves of this system to a unit step are shown in Figure 19.

### APPLICATION INFORMATION

Using the lag-lead filter in Figure 17(b) and divider N value, the transfer function for phase and frequency are shown in equations 4 and 5. Note that the transfer function for phase differs from the transfer function for frequency by only the divider N value. The difference arises from the fact that the feedback for phase is unity while the feedback for frequency is 1/N.

Hence, the transfer function of Figure 17(a) for phase is

$$\frac{\Phi_2(s)}{\Phi_1(s)} = \frac{K_p \cdot K_V}{N \cdot (T_1 + T_2)} \left[ \frac{1 + s \cdot T_2}{s^2 + s \left[ 1 + \frac{K_p \cdot K_V \cdot T_2}{N \cdot (T_1 + T_2)} \right] + \frac{K_p \cdot K_V}{N \cdot (T_1 + T_2)}} \right] \quad (4)$$

and the transfer function for frequency is

$$\frac{F_{OUT}(s)}{F_{REF}(s)} = \frac{K_p \cdot K_V}{(T_1 + T_2)} \left[ \frac{1 + s \cdot T_2}{s^2 + s \cdot \left[ 1 + \frac{K_p \cdot K_V \cdot T_2}{N \cdot (T_1 + T_2)} \right] + \frac{K_p \cdot K_V}{N \cdot (T_1 + T_2)}} \right] \quad (5)$$

The standard 2-pole denominator is  $D = s^2 + 2 \zeta \omega_n s + \omega_n^2$  and comparing the coefficients of the denominator of equation (4) and (5) with the standard 2-pole denominator gives the following results.

$$\omega_n = \sqrt{\frac{K_p \cdot K_V}{N \cdot (T_1 + T_2)}} \quad (6)$$

Solving for  $T_1 + T_2$

$$T_1 + T_2 = \frac{K_p \cdot K_V}{N \cdot \omega_n^2}$$

and by using this value for  $T_1 + T_2$  in equation (6) the damping factor is

$$\zeta = \frac{\omega_n}{2} \cdot \left( T_2 + \frac{N}{K_p \cdot K_V} \right) \quad (7)$$

solving for  $T_2$

$$T_2 = \frac{2 \zeta}{\omega_n} - \frac{N}{K_p \cdot K_V} \quad (8)$$

then by substituting for  $T_2$  in equation (6)

$$T_1 = \frac{K_V \cdot K_p}{N \cdot \omega_n^2} - \frac{2 \zeta}{\omega_n} + \frac{N}{K_p \cdot K_V} \quad (9)$$

# TLC2933 HIGH-PERFORMANCE PHASE-LOCKED LOOP

SLAS136A – APRIL 1996 – REVISED JUNE 1997

---

## APPLICATION INFORMATION

From the circuit constants and the initial design parameters then

$$R2 = \left[ \frac{2 \zeta}{\omega_n} - \frac{N}{K_p \cdot K_V} \right] \frac{1}{C1} \quad (10)$$

$$R1 = \left[ \frac{K_p \cdot K_V}{\omega_n^2 \cdot N} - \frac{2 \zeta}{\omega_n} + \frac{N}{K_p \cdot K_V} \right] \frac{1}{C1} \quad (11)$$

The capacitor, C1, is usually chosen between 1  $\mu$ F and 0.1  $\mu$ F to allow for reasonable resistor values and physical capacitor size.

PCB layout considerations

The TLC2933 contains a high frequency oscillator; therefore, very careful breadboarding and PCB layout is required for evaluation.

The following design recommendations benefit the TLC2933 user:

- External analog and digital circuitry should be physically separated and shielded as much as possible to reduce system noise.
- Radio frequency (RF) breadboarding or RF PCB techniques should be used throughout the evaluation and production process.
- Wide ground leads or a ground plane should be used on the PCB layouts to minimize parasitic inductance and resistance. The ground plane is the better choice for noise reduction.
- LOGIC  $V_{DD}$  and VCO  $V_{DD}$  should be separate PCB traces and connected to the best filtered supply point available in the system to minimize supply cross-coupling.
- VCO  $V_{DD}$  to ground and LOGIC  $V_{DD}$  to ground should be decoupled with a 0.1- $\mu$ F capacitor placed as close as possible to the appropriate device terminals.
- The no-connection (NC) terminal on the package should be connected to ground to prevent stray pickup.

## **IMPORTANT NOTICE**

Texas Instruments (TI) reserves the right to make changes to its products or to discontinue any semiconductor product or service without notice, and advises its customers to obtain the latest version of relevant information to verify, before placing orders, that the information being relied on is current.

TI warrants performance of its semiconductor products and related software to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Certain applications using semiconductor products may involve potential risks of death, personal injury, or severe property or environmental damage ("Critical Applications").

**TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, INTENDED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT APPLICATIONS, DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS.**

Inclusion of TI products in such applications is understood to be fully at the risk of the customer. Use of TI products in such applications requires the written approval of an appropriate TI officer. Questions concerning potential risk applications should be directed to TI through a local SC sales office.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards should be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein. Nor does TI warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used.
