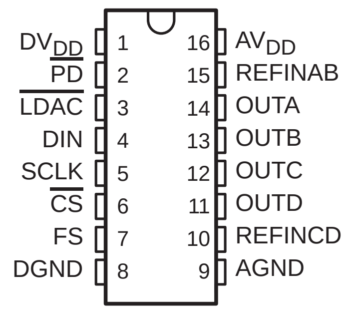
- **Four 12-Bit D/A Converters**
- **Programmable Settling Time of Either 3 µs or 9 µs Typ**
- **TMS320, (Q)SPI, and Microwire Compatible Serial Interface**
- **Internal Power-On Reset**
- **Low Power Consumption:**
  **8 mW, Slow Mode – 5-V Supply**
  **3.6 mW, Slow Mode – 3-V Supply**
- **Reference Input Buffer**
- **Voltage Output Range . . . 2× the Reference Input Voltage**
- **Monotonic Over Temperature**
- **Dual 2.7-V to 5.5-V Supply (Separate Digital and Analog Supplies)**
- **Hardware Power Down (10 nA)**
- **Software Power Down (10 nA)**
- **Simultaneous Update**

## applications

- **Battery Powered Test Instruments**
- **Digital Offset and Gain Adjustment**
- **Industrial Process Controls**
- **Machine and Motion Control Devices**
- **Communications**
- **Arbitrary Waveform Generation**

## description

**D OR PW PACKAGE**
**(TOP VIEW)**



The TLV5614 is a quadruple 12-bit voltage output digital-to-analog converter (DAC) with a flexible 4-wire serial interface. The 4-wire serial interface allows glueless interface to TMS320, SPI, QSPI, and Microwire serial ports. The TLV5614 is programmed with a 16-bit serial word comprised of a DAC address, individual DAC control bits, and a 12-bit DAC value. The device has provision for two supplies: one digital supply for the serial interface (via pins $DV_{DD}$ and DGND), and one for the DACs, reference buffers, and output buffers (via pins $AV_{DD}$ and AGND). Each supply is independent of the other, and can be any value between 2.7 V and 5.5 V. The dual supplies allow a typical application where the DAC will be controlled via a microprocessor operating on a 3 V supply (also used on pins $DV_{DD}$ and DGND), with the DACs operating on a 5 V supply. Of course, the digital and anlog supplies can be tied together.

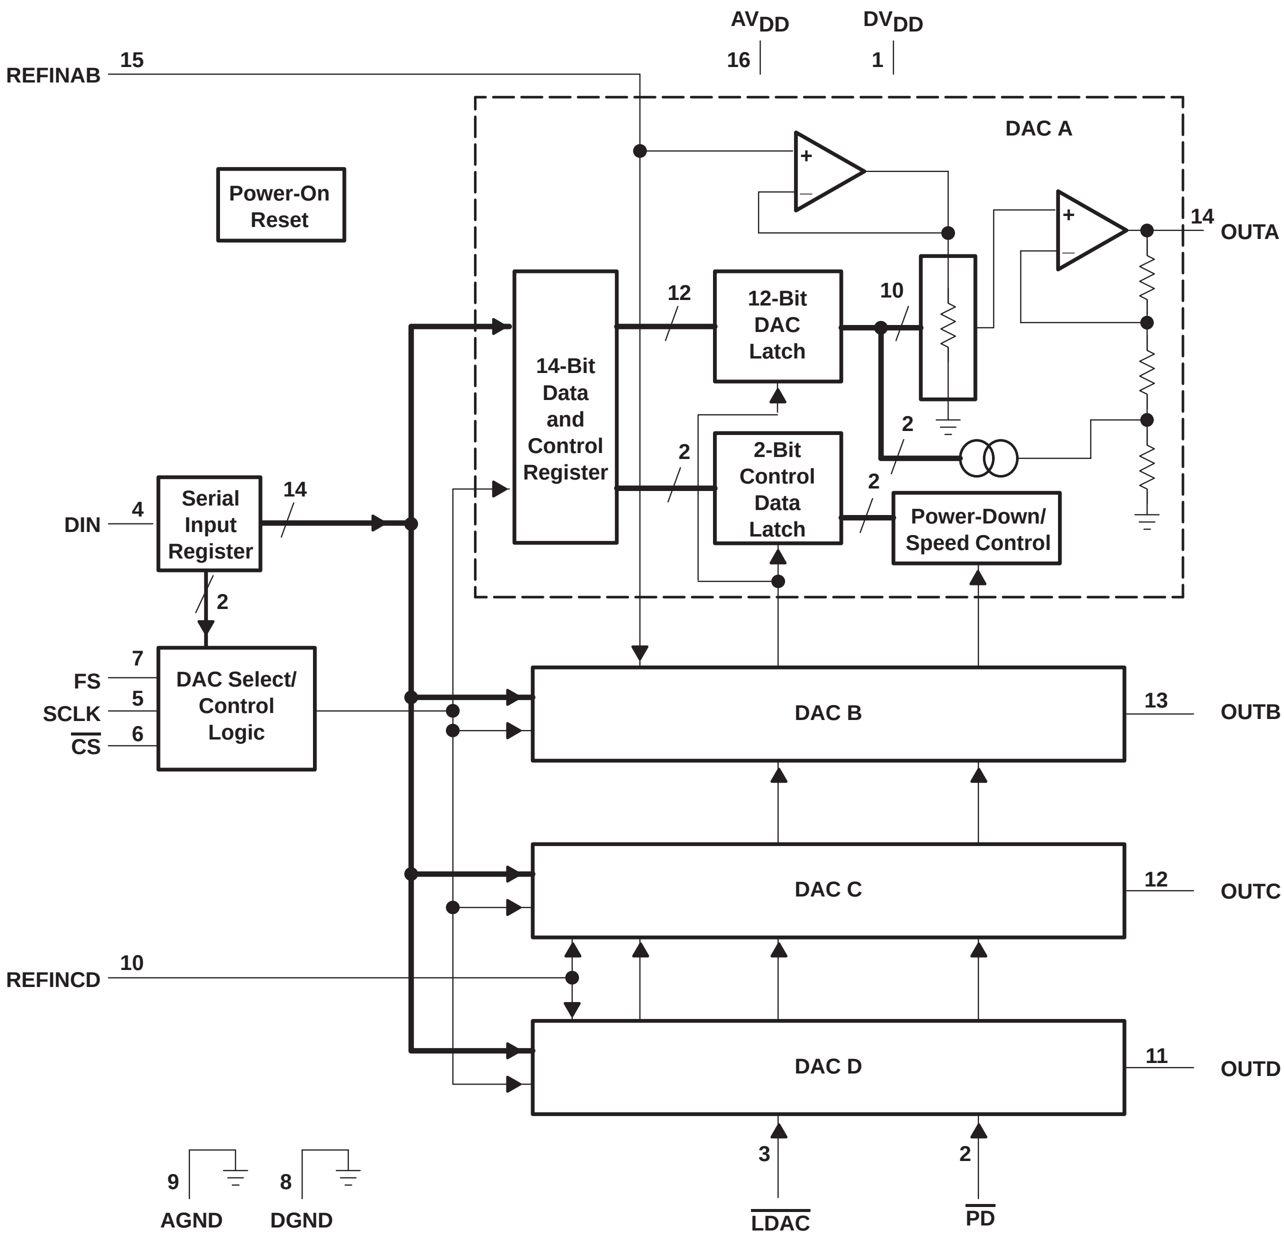
The resistor string output voltage is buffered by a x2 gain rail-to-rail output buffer. The buffer features a Class AB output stage to improve stability and reduce settling time. A rail-to-rail output stage and a power-down mode makes it ideal for single voltage, battery based applications. The settling time of the DAC is programmable to allow the designer to optimize speed versus power dissipation. The settling time is chosen by the control bits within the 16-bit serial input string. A high-impedance buffer is integrated on the REFINAB and REFINCD terminals to reduce the need for a low source impedance drive to the terminal. REFINAB and REFINCD allow DACs A and B to have a different reference voltage then DACs C and D.

The TLC5614 is implemented with a CMOS process and is available in a 16-terminal SOIC package. The TLV5614C is characterized for operation from 0°C to 70°C. The TLV5614I is characterized for operation from –40°C to 85°C.

**AVAILABLE OPTIONS**

| $T_A$ | PACKAGE | |
|---|---|---|
| | SOIC (D) | TSSOP (PW) |
| 0°C to 70°C | TLV5614CD | TLV5614CPW |
| –40°C to 85°C | TLV5614ID | TLV5614IPW |

## functional block diagram



## Terminal Functions

| TERMINAL NAME | TERMINAL NO. | I/O | DESCRIPTION |
|---|---|---|---|
| AGND | 9 | | Analog ground |
| $AV_{DD}$ | 16 | | Analog supply |
| $\overline{CS}$ | 6 | I | Chip select. This terminal is active low. |
| DGND | 8 | | Digital ground |
| DIN | 4 | I | Serial data input |
| $DV_{DD}$ | 1 | | Digital supply |
| FS | 7 | I | Frame sync input. The falling edge of the frame sync pulse indicates the start of a serial data frame shifted out to the TLV5614. |
| $\overline{PD}$ | 2 | I | Power down pin. Powers down all DACs (overriding their individual power down settings), and all output stages. This terminal is active low. |
| $\overline{LDAC}$ | 3 | I | Load DAC. When the $\overline{LDAC}$ signal is high, no DAC output updates occur when the input digital data is read into the serial interface. The DAC outputs are only updated when $\overline{LDAC}$ is low. |
| REFINAB | 15 | I | Voltage reference input for DACs A and B. |
| REFINCD | 10 | I | Voltage reference input for DACs C and D. |
| SCLK | 5 | I | Serial Clock input |
| OUTA | 14 | O | DACA output |
| OUTB | 13 | O | DACB output |
| OUTC | 12 | O | DACC output |
| OUTD | 11 | O | DACD output |

### absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Supply voltage, ($DV_{DD}$, $AV_{DD}$ to GND) . . . 7 V
Supply voltage difference, ($AV_{DD}$ to $DV_{DD}$) . . . –2.8 V to 2.8 V
Digital input voltage range . . . –0.3 V to $DV_{DD}$ + 0.3 V
Reference input voltage range . . . –0.3 V to $AV_{DD}$ + 0.3 V
Operating free-air temperature range, $T_A$: TLV5614C . . . 0°C to 70°C
TLV5614I . . . –40°C to 85°C
Storage temperature range, $T_{stg}$ . . . –65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds . . . 260°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

## recommended operating conditions

| | | MIN | NOM | MAX | UNIT |
|---|---|---|---|---|---|
| Supply voltage, $AV_{DD}$, $DV_{DD}$ | 5-V supply | 4.5 | 5 | 5.5 | V |
| | 3-V supply | 2.7 | 3 | 3.3 | |
| High-level digital input, $V_{IH}$ | $DV_{DD}$ = 2.7 V to 5.5 V | 2 | | | V |
| Low-level digital input, $V_{IL}$ | $DV_{DD}$ = 2.7 V to 5.5 V | | | 0.8 | V |
| Reference voltage, $V_{ref}$ to REFINAB, REFINCD terminal | 5-V supply, See Note 1 | 0 | 2.048 | $V_{DD}$–1.5 | V |
| | 3-V supply, See Note 1 | 0 | 1.024 | $V_{DD}$–1.5 | |
| Load resistance, $R_L$ | | 2 | 10 | | kΩ |
| Load capacitance, $C_L$ | | | | 100 | pF |
| Serial clock rate, SCLK | | | | 20 | MHz |
| Operating free-air temperature | TLV5614C | 0 | | 70 | °C |
| | TLV5614I | –40 | | 85 | |

NOTE 1: Voltages greater than $AV_{DD}/2$ will cause output saturation for large DAC codes.

## electrical characteristics over recommended operating free-air temperature range, supply voltages, and reference voltages (unless otherwise noted)

### static DAC specifications

| | PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|---|
| | Resolution | | | 12 | | | bits |
| | Integral nonlinearity (INL), end point adjusted | | See Note 2 | | ±1.5 | ±4 | LSB |
| | Differential nonlinearity (DNL) | | See Note 3 | | ±0.5 | ±1 | LSB |
| $E_{ZS}$ | Zero scale error (offset error at zero scale) | | See Note 4 | | | ±12 | mV |
| | Zero scale error temperature coefficient | | See Note 5 | | 10 | | ppm/°C |
| $E_G$ | Gain error | | See Note 6 | | | ±0.6 | % of FS voltage |
| | Gain error temperature coefficient | | See Note 7 | | 10 | | ppm/°C |
| PSRR | Power supply rejection ratio | Zero scale | See Notes 8 and 9 | | –80 | | dB |
| | | Full scale | | | –80 | | dB |

NOTES: 2. The relative accuracy or integral nonlinearity (INL) sometimes referred to as linearity error, is the maximum deviation of the output from the line between zero and full scale excluding the effects of zero code and full-scale errors.
3. The differential nonlinearity (DNL) sometimes referred to as differential error, is the difference between the measured and ideal 1 LSB amplitude change of any two adjacent codes. Monotonic means the output voltage changes in the same direction (or remains constant) as a change in the digital input code.
4. Zero-scale error is the deviation from zero voltage output when the digital input code is zero.
5. Zero-scale-error temperature coefficient is given by: $E_{ZS}\ TC = [E_{ZS}(T_{max}) - E_{ZS}(T_{min})]/V_{ref} \times 10^6/(T_{max} - T_{min})$.
6. Gain error is the deviation from the ideal output ($2\ V_{ref}$ – 1 LSB) with an output load of 10 kΩ excluding the effects of the zero-error.
7. Gain temperature coefficient is given by: $E_G\ TC = [E_G(T_{max}) - E_G(T_{min})]/V_{ref} \times 10^6/(T_{max} - T_{min})$.
8. Zero-scale-error rejection ratio (EZS–RR) is measured by varying the $AV_{DD}$ from 5 ± 0.5 V and 3 ± 0.5 V dc, and measuring the proportion of this signal imposed on the zero-code output voltage.
9. Full-scale rejection ratio (EG-RR) is measured by varying the $AV_{DD}$ from 5 ± 0.5 V and 3 ± 0.5 V dc and measuring the proportion of this signal imposed on the full-scale output voltage after subtracting the zero scale change.

## electrical characteristics over recommended operating free-air temperature range, supply voltages, and reference voltages (unless otherwise noted) (continued)

### individual DAC output specifications

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| $V_O$ | Voltage output range | $R_L$ = 10 kΩ | 0 | | $AV_{DD}$–0.4 | V |
| | Output load regulation accuracy | $R_L$ = 2 kΩ vs 10 kΩ | | 0.1 | 0.25 | % of FS voltage |

### reference inputs (REFINAB, REFINCD)

| PARAMETER | | TEST CONDITIONS | | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|---|
| $V_I$ | Input voltage range | See Note 10 | | 0 | | $AV_{DD}$–1.5 | V |
| $R_I$ | Input resistance | | | | 10 | | MΩ |
| $C_I$ | Input capacitance | | | | 5 | | pF |
| | Reference feed through | REFIN = 1 $V_{pp}$ at 1 kHz + 1.024 V dc (see Note 11) | | | –75 | | dB |
| | Reference input bandwidth | REFIN = 0.2 $V_{pp}$ + 1.024 V dc large signal | Slow | | 0.5 | | MHz |
| | | | Fast | | 1 | | |

NOTES: 10. Reference input voltages greater than $V_{DD}$/2 will cause output saturation for large DAC codes.
11. Reference feedthrough is measured at the DAC output with an input code = 000 hex and a $V_{ref}$ (REFINAB or REFINCD) input = 1.024 Vdc + 1 $V_{pp}$ at 1 kHz.

### digital inputs (DIN, $\overline{CS}$, $\overline{LDAC}$, $\overline{PD}$)

| PARAMETER | | TEST CONDITIONS | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|
| $I_{IH}$ | High-level digital input current | $V_I = V_{DD}$ | | | ±1 | μA |
| $I_{IL}$ | Low-level digital input current | $V_I$ = 0 V | | | ±1 | μA |
| $C_I$ | Input capacitance | | | 3 | | pF |

### power supply

| PARAMETER | | TEST CONDITIONS | | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|---|
| $I_{DD}$ | Power supply current | 5-V supply, No load, Clock running, All inputs 0 V or $V_{DD}$ | Slow | | 1.6 | 2.4 | mA |
| | | | Fast | | 3.8 | 5.6 | |
| | | 3-V supply, No load, Clock running, All inputs 0 V or $DV_{DD}$ | Slow | | 1.2 | 1.8 | mA |
| | | | Fast | | 3.2 | 4.8 | |
| | Power down supply current (see Figure 12) | | | | 10 | | nA |

## electrical characteristics over recommended operating free-air temperature range, supply voltages, and reference voltages (unless otherwise noted) (continued)

### analog output dynamic performance

| PARAMETER | | TEST CONDITIONS | | MIN | TYP | MAX | UNIT |
|---|---|---|---|---|---|---|---|
| SR | Output slew rate | $C_L$ = 100 pF, $R_L$ = 10 kΩ, $V_O$ = 10% to 90%, $V_{ref}$ = 2.048 V, 1024 V | Fast | | 5 | | V/μs |
| | | | Slow | | 1 | | V/μs |
| $t_s$ | Output settling time | To ± 0.5 LSB, $C_L$ = 100 pF, $R_L$ = 10 kΩ, See Notes 12 and 14 | Fast | | 3 | 5.5 | μs |
| | | | Slow | | 9 | 20 | |
| $t_{s(c)}$ | Output settling time, code to code | To ± 0.5 LSB, $C_L$ = 100 pF, $R_L$ = 10 kΩ, See Note 15 | Fast | | 1 | | μs |
| | | | Slow | | 2 | | |
| | Glitch energy | Code transition from 7FF to 800 | | | 10 | | nV-sec |
| SNR | Signal-to-noise ratio | Sinewave generated by DAC, Reference voltage = 1.024 at 3 V and 2.048 at 5 V, $f_s$ = 400 KSPS, $f_{OUT}$ = 1.1 kHz sinewave, $C_L$ = 100 pF, $R_L$ = 10 kΩ, BW = 20 kHz | | | 74 | | dB |
| S/(N+D) | Signal to noise + distortion | | | | 66 | | |
| THD | Total harmonic Distortion | | | | –68 | | |
| SFDR | Spurious free dynamic range | | | | 70 | | |

NOTES: 12. Settling time is the time for the output signal to remain within ±0.5 LSB of the final measured value for a digital input code change ofFFF hex to 080 hex for 080 hex to FFF hex.
13. Settling time is the time for the output signal to remain within ±0.5 LSB of the final measured value for a digital input code change of one count.
14. Limits are ensured by design and characterization, but are not production tested.

## electrical characteristics over recommended operating free-air temperature range, supply voltages, and reference voltages (unless otherwise noted) (continued)

### digital input timing requirements

| | | MIN | NOM | MAX | UNIT |
|---|---|---|---|---|---|
| $t_{su(CS–FS)}$ | Setup time, $\overline{CS}$ low before FS↓ | 10 | | | ns |
| $t_{su(FS–CK)}$ | Setup time, FS low before first negative SCLK edge | 8 | | | ns |
| $t_{su(C16–FS)}$ | Setup time, sixteenth negative edge after FS low on which bit D0 is sampled before rising edge of FS | 10 | | | ns |
| $t_{su(C16–CS)}$ | Setup time, sixteenth positive SCLK edge (first positive after D0 is sampled) before $\overline{CS}$ rising edge. If FS is used instead of the sixteenth positive edge to update the DAC, then the setup time is between the FS rising edge and $\overline{CS}$ rising edge. | 10 | | | ns |
| $t_{wH}$ | Pulse duration, SCLK high | 25 | | | ns |
| $t_{wL}$ | Pulse duration, SCLK low | 25 | | | ns |
| $t_{su(D)}$ | Setup time, data ready before SCLK falling edge | 8 | | | ns |
| $t_{h(D)}$ | Hold time, data held valid after SCLK falling edge | 5 | | | ns |
| $t_{wH(FS)}$ | Pulse duration, FS high | 20 | | | ns |

## APPLICATION INFORMATION

### general function

The TLV5614 is a 12-bit single supply DAC based on a resistor string architecture. The device consists of a serial interface, speed and power down control logic, a reference input buffer, a resistor string, and a rail-to-rail output buffer.

The output voltage (full scale determined by external reference) is given by:

$$2\ \mathrm{REF}\ \frac{\mathrm{CODE}}{0\mathrm{x}1000}\ [\mathrm{V}]$$

Where REF is the reference voltage and CODE is the digital input value within the range of 0x000 to 0xFFF. A power-on reset initially resets the internal latches to a defined state (all bits zero).

### serial interface

Explanation of data transfer: First, the device has to be enabled with $\overline{\mathrm{CS}}$ set to low. Then, a falling edge of FS starts shifting the data bit-per-bit (starting with the MSB) to the internal register on the falling edges of SCLK. After 16 bits have been transferred or FS rises, the content of the shift register is moved to the DAC latch which updates the voltage output to the new level.

The serial interface of the TLV5614 can be used in two basic modes:

- four wire (with chip select)
- three wire (without chip select)

Using chip select (four wire mode), it is possible to have more than one device connected to the serial port of the data source (DSP or microcontroller). The interface is compatible with the TMS320 family. Figure 15 shows an example with two TLV5614s connected directly to a TMS320 DSP.

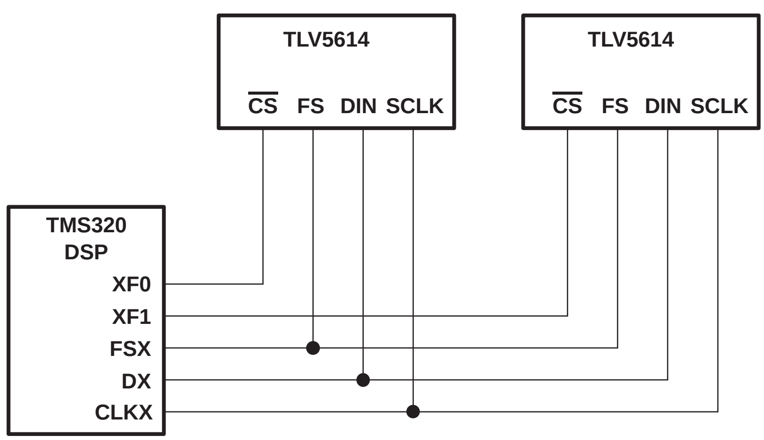

**Figure 15. TMS320 Interface**

## APPLICATION INFORMATION

### serial interface (continued)

If there is no need to have more than one device on the serial bus, then $\overline{CS}$ can be tied low. Figure 16 shows an example of how to connect the TLV5614 to a TMS320, SPI, or Microwire port using only three pins.

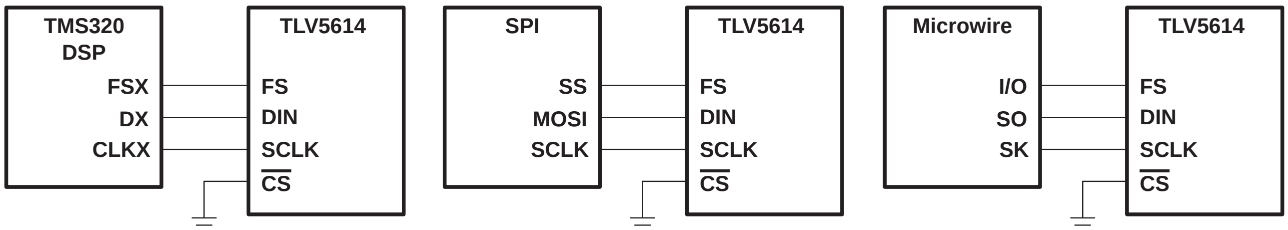

**Figure 16. Three-Wire Interface**

Notes on SPI and Microwire: Before the controller starts the data transfer, the software has to generate a falling edge on the I/O pin connected to FS. If the word width is 8 bits (SPI and Microwire), two write operations must be performed to program the TLV5614. After the write operation(s), the DAC output is updated automatically on the sixteenth positive clock edge.

### serial clock frequency and update rate

The maximum serial clock frequency is given by:

$$f_{SCLKmax} = \frac{1}{t_{wH(min)} + t_{wL(min)}} = 20\ \text{MHz}$$

The maximum update rate is:

$$f_{UPDATEmax} = \frac{1}{16\left(t_{wH(min)} + t_{wL(min)}\right)} = 1.25\ \text{MHz}$$

Note that the maximum update rate is a theoretical value for the serial interface since the settling time of the TLV5614 has to be considered also.

### data format

The 16-bit data word for the TLV5614 consists of two parts:

- Control bits (D15 . . . D12)
- New DAC value (D11 . . . D0)

| D15 | D14 | D13 | D12 | D11 | D10 | D9 | D8 | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| A1 | A0 | PWR | SPD | New DAC value (12 bits) | | | | | | | | | | | |

X: don’t care
SPD: Speed control bit. 1 → fast mode 0 → slow mode
PWR: Power control bit. 1 → power down 0 → normal operation

## APPLICATION INFORMATION

In power down mode, all amplifiers within the TLV5614 are disabled. A particular DAC (A, B, C, D) of the TLV5614 is selected by A1 and A0 within the input word.

| A1 | A0 | DAC |
|---|---|---|
| 0 | 0 | A |
| 0 | 1 | B |
| 1 | 0 | C |
| 1 | 1 | D |

## TLV5614 interfaced to TMS320C203 DSP

### hardware interfacing

Figure 17 shows an example of how to connect the TLV5614 to a TMS320C203 DSP. The serial port is configured in burst mode, with FSX generated by the TMS320C203 to provide the frame sync (FS) input to the TLV5614. Data is transmitted on the DX line, with the serial clock input on the CLKX line. The general-purpose input/output port bits IO0 and IO1 are used to generate the chip select ($\overline{CS}$) and DAC latch update ($\overline{LDAC}$) inputs to the TLV5614. The active low power down ($\overline{PD}$) is pulled high all the time to ensure the DACs are enabled.

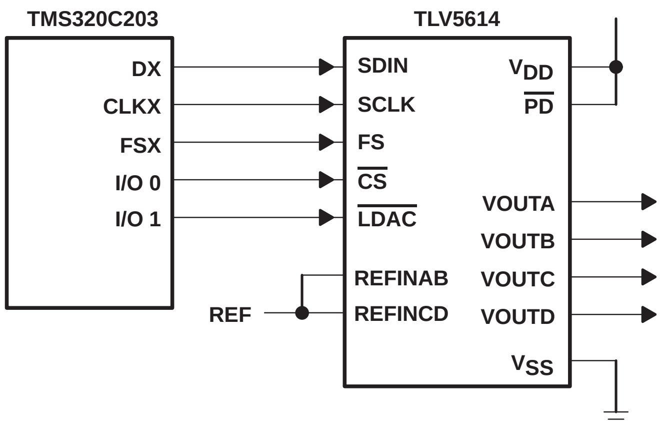

**Figure 17. TLV5614 Interfaced with TMS320C203**

### software

The application example outputs a differential in-phase (sine) signal between the VOUTA and VOUTB pins, and it’s quadrature (cosine) signal as the differential signal between VOUTC and VOUTD.

The on-chip timer is used to generate interrupts at a fixed frequency. The related interrupt service routine pulses $\overline{LDAC}$ low to update all 4 DACs simultaneously, then fetches and writes the next sample to all 4 DACs. The samples are stored in a look-up table, which describes two full periods of a sine wave.

The synchronous serial port of the DSP is used in burst mode. In this mode, the processor generates an FS pulse preceding the MSB of every data word. If multiple, contiguous words are transmitted, a violation of the tsu(C16–FS) timing requirement will occur. To avoid this, the program waits until the transmission of the previous word has been completed.

## APPLICATION INFORMATION

```
;-------------------------------------------------------------------------------------
; Processor:  TMS320C203 runnning at 40 MHz
;
; Description:
;
; This program generates a differential in–phase (sine) on (OUTA–OUTB) and it’s
; quadrature (cosine) as a differential signal on (OUTC–OUTD).
;
; The DAC codes for the signal samples are stored as a table of 64 12–bit values,
; describing 2 periods of a sine function. A rolling pointer is used to address the
; table location in the first period of this waveform, from which the DAC A samples
; are read. The samples for the other 3 DACs are read at an offset to this rolling
; pointer:
;  DAC    Function      Offset from rolling pointer
;   A     sine          0
;   B     inverse sine  16
;   C     cosine        8
;   D     inverse cosine24
;
; The on–chip timer is used to generate interrupts at a fixed rate. The interrupt
; service routine first pulses LDAC low to update all DACs simultaneously
; with the values which were written to them in the previous interrupt. Then all
; 4 DAC values are fetched and written out through the synchronous serial interface
; Finally, the rolling pointer is incremented to address the next sample, ready for
; the next interrupt.

## APPLICATION INFORMATION

### TLV5614 interfaced to MCS®51 microcontroller

#### hardware iInterfacing

Figure 18 shows an example of how to connect the TLV5614 to an MCS®51 Microcontroller. The serial DAC input data and external control signals are sent via I/O Port 3 of the controller. The serial data is sent on the RxD line, with the serial clock output on the TxD line. Port 3 bits 3, 4, and 5 are configured as outputs to provide the DAC latch update (LDAC), chip select (CS) and frame sync (FS) signals for the TLV5614. The active low power down pin (PD) of the TLV5614 is pulled high to ensure that the DACs are enabled.

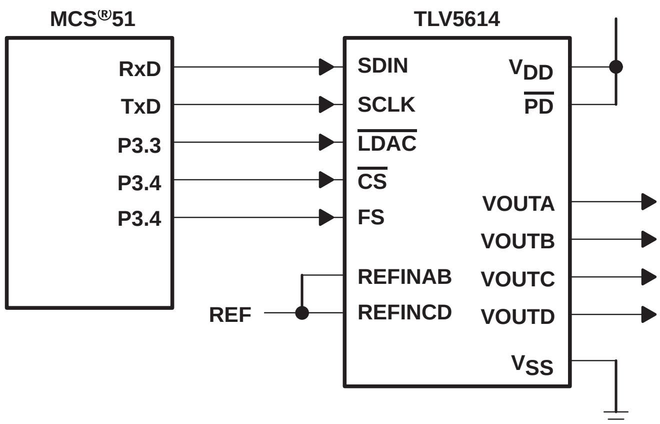

**Figure 18. TLV5614 Interfaced with MCS®51**

#### software

The example is the same as for the TMS320C203 in this datasheet, but adapted for a MCS®51 controller. It generates a differential in-phase (sine) signal between the VOUTA and VOUTB pins, and it's quadrature (cosine) signal as the differential signal between VOUTC and VOUTD.

The on-chip timer is used to generate interrupts at a fixed frequency. The related interrupt service routine pulses LDAC low to update all 4 DACs simultaneously, then fetches and writes the next sample to all 4 DACs. The samples are stored as a look-up table, which describes one full period of a sine wave.

The serial port of the controller is used in Mode 0, which transmits 8 bits of data on RxD, accompanied by a synchronous clock on TxD. Two writes concatenated together are required to write a comlpete word to the TLV5614. The CS and FS signals are provided in the required fashion through control of IO port 3, which has bit addressable outputs.

## APPLICATION INFORMATION
