- **Single-Supply Operation:**  
**Input Voltage Range Extends to Ground and Output Swings to Ground While Sinking Current**
- **Input Offset Voltage . . . 300  $\mu\text{V}$  Max at 25°C for LT1014**
- **Offset Voltage Temperature Coefficient 2.5  $\mu\text{V}/^\circ\text{C}$  Max at LT1014**
- **Input Offset Current . . . 1.5 nA Max at 25°C for LT1014**
- **High Gain . . . 1.2 V/ $\mu\text{V}$  Min ( $R_L = 2 \text{ k}\Omega$ ), 0.5 V/ $\mu\text{V}$  Min ( $R_L = 600 \Omega$ ) for LT1014**
- **Low Supply Current . . . 2.2 mA Max at 25°C for LT1014**
- **Low Peak-to-Peak Noise Voltage 0.55  $\mu\text{V}$  Typ**
- **Low Current Noise . . . 0.07 pA/ $\sqrt{\text{Hz}}$  Typ**

## description

The LT1014, LT1014A, and LT1014D are precision quad operational amplifiers with 14-pin industry-standard configuration. They feature low offset-voltage temperature coefficient, high gain, low supply current, and low noise.

The LT1014, LT1014A, and LT1014D can be operated with both dual  $\pm 15 \text{ V}$  and single 5-V power supplies. The common-mode input voltage range includes ground, and the output voltage can also swing to within a few milivolts of ground. Crossover distortion is eliminated.

The LT1014C and LT1014AC are characterized for operation from 0°C to 70°C. The LT1014I and LT1014DI are characterized for operation from -40°C to 105°C. The LT1014M, LT1014AM and LT1014DM are characterized for operation over the full military temperature range of -55°C to 125°C.

NC – No internal connection

## AVAILABLE OPTIONS

TA	$V_{IO}$ max AT 25°C	PACKAGE			
		SMALL OUTLINE (W)	CHIP CARRIER (FK)	CERAMIC DIP (JG)	PLASTIC DIP (P)
0°C to 70°C	300 $\mu\text{V}$ 800 $\mu\text{V}$	— LT1014DDW	— —	— —	LT1014CN LT1014DN
-40°C to 105°C	300 $\mu\text{V}$ 800 $\mu\text{V}$	— LT1014DIDW	— —	— —	LT1014IN LT1014DIN
-55°C to 125°C	180 $\mu\text{V}$ 300 $\mu\text{V}$ 800 $\mu\text{V}$	— — LT1014DMDW	LT1014AMFK LT1014MFK —	LT1014AMJ LT1014MJ —	— LT1014MN LT1014DMN

The DW package is available taped and reeled. Add the suffix R to the device type, (e.g., LT1014DDWR).

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

schematic (each amplifier)

Component values are nominal.

**absolute maximum ratings over operating free-air temperature range (unless otherwise noted)**

Supply voltage, $V_{CC+}$ (see Note 1) .....	22 V
Supply voltage, $V_{CC-}$ (see Note 1) .....	-22 V
Differential input voltage (see Note 2) .....	$\pm 30$ V
Input voltage range, $V_I$ (any input, see Note 1) .....	$V_{CC-} - 5$ V to $V_{CC+}$
Duration of short-circuit current at (or below) $T_A = 25^\circ\text{C}$ (see Note 3) .....	unlimited
Continuous total power dissipation .....	See Dissipation Rating Table
Operating free-air temperature range, $T_A$ : LT1014C, LT1014DC .....	-0°C to 70°C
LT1014I, LT10134DI .....	-40°C to 105°C
LT1014M, LT1014AM, LT1014DM .....	-55°C to 125°C
Storage temperature range .....	-65°C to 150°C
Lead temperature 1.6 mm (1/16 inch) from case for 60 seconds: J package .....	300°C
Lead temperature 1.6 mm (1/16 inch) from case for 10 seconds: DW or N package .....	260°C
Case temperature for 60 seconds: FK package .....	260°C

- NOTES: 1. All voltage values, except differential voltages, are with respect to the midpoint between  $V_{CC+}$  and  $V_{CC-}$ .  
 2. Differential voltages are at the noninverting input with respect to the inverting input.  
 3. The output may be shorted to either supply.

## APPLICATION INFORMATION

### single-supply operation

The LT1014 is fully specified for single-supply operation ( $V_{CC-} = 0$ ). The common-mode input voltage range includes ground, and the output swings within a few millivolts of ground.

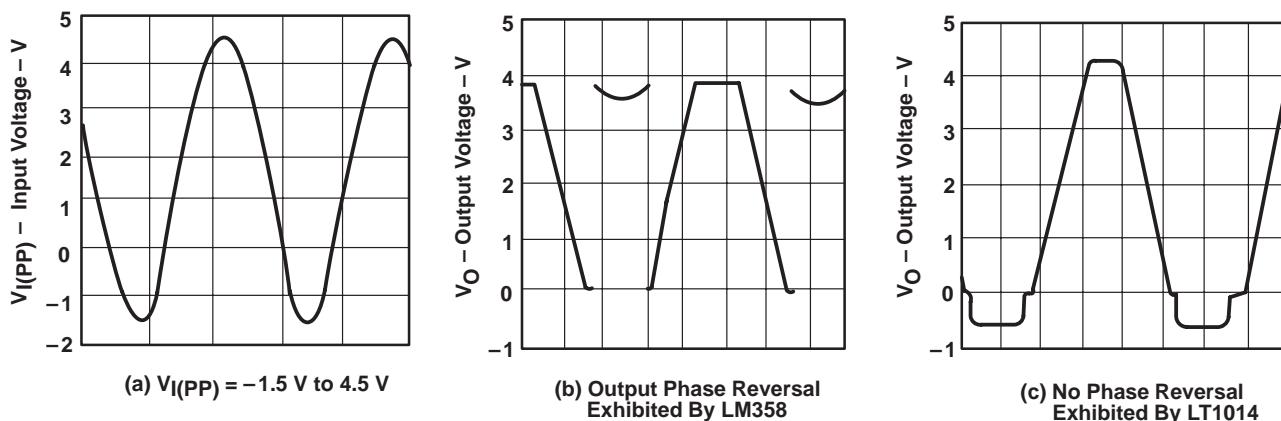

Furthermore, the LT1014 has specific circuitry that addresses the difficulties of single-supply operation, both at the input and at the output. At the input, the driving signal can fall below 0 V, either inadvertently or on a transient basis. If the input is more than a few hundred millivolts below ground, the LT1014 is designed to deal with the following two problems that can occur:

1. On many other operational amplifiers, when the input is more than a diode drop below ground, unlimited current will flow from the substrate ( $V_{CC-}$  terminal) to the input, which can destroy the unit. On the LT1014, the 400- $\Omega$  resistors in series with the input (see schematic) protect the device even when the input is 5 V below ground.
2. When the input is more than 400 mV below ground (at  $T_A = 25^\circ\text{C}$ ), the input stage of similar type operational amplifiers saturates and phase reversal occurs at the output. This can cause lock-up in servo systems. Because of a unique phase-reversal protection circuitry (Q21, Q22, Q27, and Q28), the LT1014 outputs do not reverse, even when the inputs are at  $-1.5\text{ V}$  (see Figure 24).

This phase-reversal protection circuitry, however, does not function when the other operational amplifier on the LT1014 is driven hard into negative saturation at the output. Phase-reversal protection does not work on amplifier:

- 1 when 4's output is in negative saturation (the outputs of 2 and 3 have no effect).
- 2 when 3's output is in negative saturation (the outputs of 1 and 4 have no effect).
- 3 when 2's output is in negative saturation (the outputs of 1 and 4 have no effect).
- 4 when 1's output is in negative saturation (the outputs of 2 and 3 have no effect).

At the output, other single-supply designs either cannot swing to within 600 mV of ground or cannot sink more than a few microamperes while swinging to ground. The all-NPN output stage of the LT1014 maintains its low output resistance and high gain characteristics until the output is saturated. In dual-supply operations, the output stage is free of crossover distortion.

## APPLICATION INFORMATION

### comparator applications

The single-supply operation of the LT1014 lends itself for use as a precision comparator with TTL-compatible output. In systems using both operational amplifiers and comparators, the LT1014 can perform multiple duties. Refer to Figures 25 and 26.

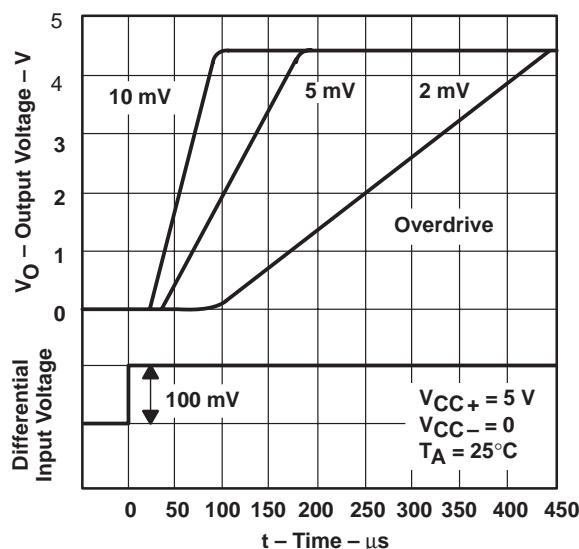

Figure 25. Low-to-High-Level Output Response for Various Input Overdrives

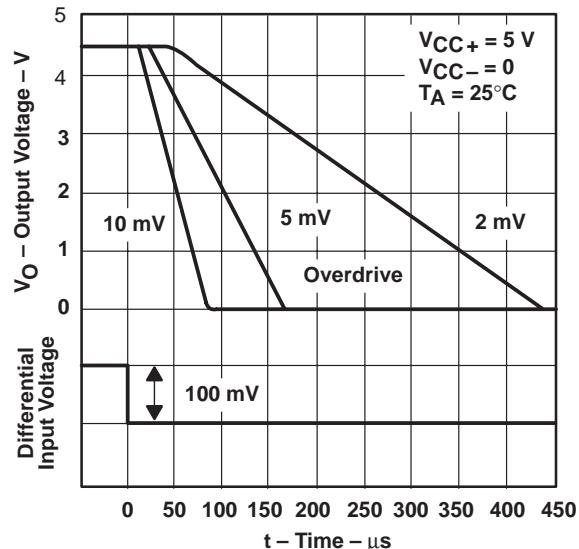

Figure 26. High-to-Low-Level Output Response for Various Input Overdrives

### low-supply operation

The minimum supply voltage for proper operation of the LT1014 is 3.4 V (three Ni-Cad batteries). Typical supply current at this voltage is 290  $\mu$ A; therefore, power dissipation is only 1 mW per amplifier.

### offset voltage and noise testing

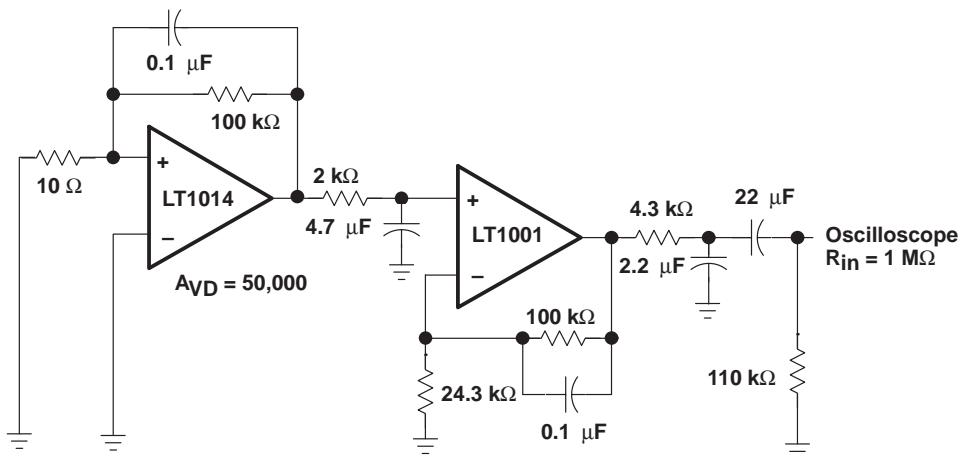

The test circuit for measuring input offset voltage and its temperature coefficient is shown in Figure 30. This circuit with supply voltages increased to  $\pm 20$  V is also used as the burn-in configuration.

The peak-to-peak equivalent input noise voltage of the LT1014 is measured using the test circuit shown in Figure 27. The frequency response of the noise tester indicates that the 0.1-Hz corner is defined by only one zero. The test time to measure 0.1-Hz to 10-Hz noise should not exceed 10 seconds, as this time limit acts as an additional zero to eliminate noise contribution from the frequency band below 0.1 Hz.

An input noise voltage test is recommended when measuring the noise of a large number of units. A 10-Hz input noise voltage measurement correlates well with a 0.1-Hz peak-to-peak noise reading because both results are determined by the white noise and the location of the 1/f corner frequency.

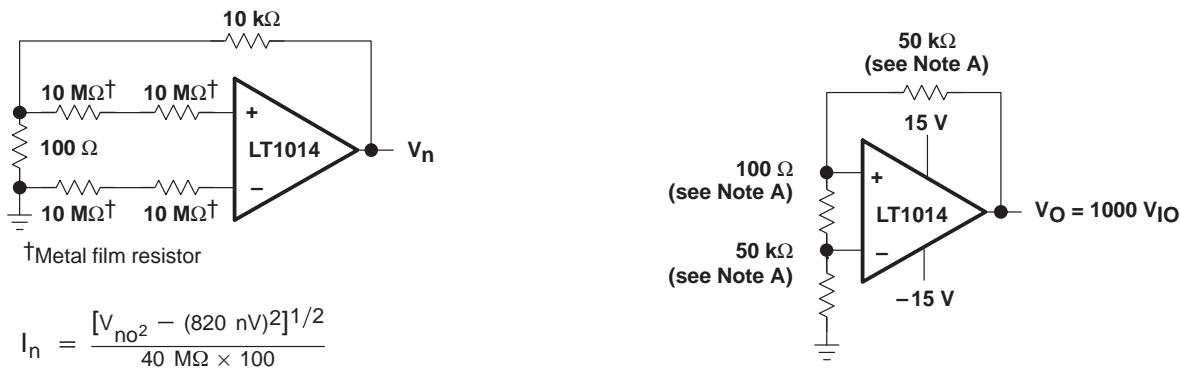

Current noise is measured by the circuit and formula shown in Figure 28. The noise of the source resistors is subtracted.

## APPLICATION INFORMATION

NOTE: All capacitor values are for nonpolarized capacitors only.
