

Icom CI-V Computer Interface System

I am not a small business nor am I in the business of selling amateur radio products. I am a retired broadcast engineer who has enjoyed our hobby for over 50 years and love to homebrew equipment that can be used in the shack. I discovered many years ago that it is possible to produce professional quality products for a fraction of the cost of commercial gear.

Some time ago I became interested in interfacing my Icom-703 to my desktop and laptop computers and began looking around for circuits and existing products. I found numerous circuits and lots of over-priced products. I built lots of different circuits and they all worked as advertised. I picked the best of the bunch and thought I would offer them to my fellow 703 enthusiasts a very reasonable prices.

If you are interested in interfacing you're IC-703 to your computer then check out my webpage at <http://www.w7ji.com> You can save a few bucks and if you would prefer to build your own, I have a circuit board and plans available as one of the options.
