

FRONT RUNNER

CRISIS

A ruthless race of aliens has taken possession of the Empire State Building. Your goal is to rescue the hostages.

KANGARILLA

Your baby kangaroo has wandered to the top of a four-level maze, and you must rescue him.

REBOUND

Fire the moving ball into the colored goal in the center of your screen, but count the barriers you erect with each press of the joystick. They block or bounce your ball in the right direction — and lower your score as they accumulate.

Like SoftSide? Wait 'til you've seen our **BEST!**

The Best of SoftSide!

For the past four years, SoftSide Magazine has been bringing Apple®, Atari®, and TRS-80® owners the best in BASIC software. But now you can do even better... The Best of SoftSide. From all our back issues, we've selected the most useful...the most entertaining...the most fun programs SoftSide has ever published.

The Best of SoftSide is available in three versions...one for Apple, Atari, and TRS-80. Each contains page after page of BASIC code for adventures, simulations, practical applications, and much more.

To order your copy of The Best of SoftSide, fill out the coupon, and mail it along with \$14.95 to SoftSide, 10 Northern Blvd., Northwood Executive Park, Amherst, New Hampshire 03031.

lower case. Many programs we publish contain lower case. Since, **STOMP**, **SoftSide's** debugging utility, ignores the case of characters, you may use capital letters if you so desire or if your Apple doesn't have lower case.

- **REM** and **DATA** statements: **STOMP**, like Applesoft, ignores **REM** statements. You do not have to type the text of **REMs**. **STOMP** also ignores the space or spaces between the keyword **DATA** and the first data element. Type numbers and strings in **DATA** statements exactly as they appear in the published listing.

- Spaces between quotes: Applesoft is a bit eccentric about how it shows these. Just list the line after you type it, and compare it to the printed listing.

Also, be sure to use **STOMP** on your program, and get the free reprint if you don't have **STOMP**.

ATARI®USERS

- The line listings in this booklet are in standard 38-column format, with special conventions for representing unprintable characters:
- You must type underlined characters, including blank spaces, in inverse video.

- When graphics or control characters are included in a string (between quotation marks), a nearby **REM** statement will make note of it; in such cases, graphics characters appear as the corresponding lower-case letters, and control characters appear as the corresponding unshifted key symbols. For example: The lower-case letter **s** represents a graphic cross, which you type by pressing the **S** key while holding down the **CTRL** key; the **=** sign represents **CTRL-down-arrow**, which you type by pressing and releasing the **ESC** key, then pressing the **=** key while holding down **CTRL**. For more information about entering control characters, refer to Appendix F and the back cover of your **Atari Reference Manual**.

There are two exceptions to our above convention: A clear-screen character (**ESC SHIFT-CLEAR**) appears in our listings as a right-hand brace, which looks like this: **}**. The other exception is that a shifted **=** sign appears as a broken, vertical line: **|_**.

Occasionally, a program will demand that we vary from these conventions. In such a case, a nearby **REM** statement or the program's introductory article will clearly note the special instructions.

These programs are for your personal use only. Please resist the urge to give away copies of copyrighted material.

General Information

These are the standard procedures for the programs published by **SoftSide Publications, Inc.** Sometimes, a particular program does not lend itself to these procedures. Always read the specific instructions accompanying a program. They will instruct you if there are any variances from the following procedures. Also, back issues of **SoftSide Magazine** may differ in some details.

STOMP Tables

At the conclusion of each **SoftSide** listing, we include a **STOMP Table**. **STOMP** for the Atari appeared in issue #45. **STOMP** supersedes **SWAT** as **SoftSide**'s standard debugging tool to help those who type **BASIC** programs from the pages of **SoftSide Selections**. If you don't have **STOMP**, we'll send you a free reprint. Send a business-sized, self-addressed, stamped envelope to:

SoftSide Publications, Inc.
Department **STOMP**
10 Northern Blvd.
Northwood Executive Park
Amherst, NH 03031

Be sure to tell us what kind of computer you have.

Line Listings

IBM®PC USERS

The line listings in this booklet appear in a 40-column format. If you type **LIST** when your computer is displaying 40-column text (**WIDTH 40**), your screen should display exactly what appears in the printed listing. Be sure to use **STOMP** on your program, and get the free reprint if you don't have **STOMP**.

APPLE® USERS

The line listings in this booklet are in standard **Applesoft®** format, and they appear exactly as they should on your screen when you type **LIST**. Beginning with issue #45, **Applesoft** listings in **SoftSide Selections** may have lower-case characters in them. If you have an Apple IIe or an Apple II with a lower-case adapter, you may type these listings exactly as they appear. If you have an Apple II without lower case, simply type the lower-case characters as capitals. **STOMP**, **SoftSide**'s debugging utility, ignores the case of characters, so both ways of typing programs result in the same **STOMP Table**.

Things to watch out for when typing are:

- Lower-case characters: The Apple IIe and some Apple II's have

Variables

- A\$: Used to hold graphics.
 AT: Allowed time in which to finish a round. TT counts up to AT by one for each movement of the ball.
 CHBAS: This times 256 is the low end of the transferred character set.
 CHROM: This times 256 is the low end of the ROM character set.
 DIR: Current direction of the ball.
 DS: The number of barriers placed in the current round. If DS=0 at the end of a round, then a lucky serve happened.
 EN: Controls program flow by determining whether to skip line 300.
 NI: The constant 1.
 NUM: The actual number of rounds to play.
 OXP: Old x position. The x-coordinate of the ball's previous screen position, used in erasing the ball.
 OYP: Old y position.
 P: Miscellaneous.
 PL: Which player is currently playing.
 RN: The current round number.
 S: Miscellaneous.
 SCI: Player 1's score.
 SC2: Player 2's score.
 SK1: Player 1's skill level.
 SK2: Player 2's skill level.
 SL(*, *): Stores up to the first 50 barriers placed in each round.
 SL(*, 1) stores the x-coordinate, SL(*, 2) stores the y-coordinate, and SL(*, 3) stores the type of barrier.
 ST(*): Stores the joystick port numbers for the two players.
 STR: Score this round. Holds the score earned in the most recently completed round.
- T: Used for time delays.
 TDIR: Temporary direction. Holds possible new direction of ball after a barrier is hit.
 TENS: Used in getting the 10's digit of the number of rounds to play.
 TS: Temporary slash (barrier). Since a player can place a barrier only once for every two movements of the ball, TS is set to 1 when a barrier is placed and set to 0 when the ball moves. The player cannot place a barrier when TS equals 1.
 TT: Total time used each round. If TT reaches the value of AT, then too much time has gone by.
 WUNS: Used in getting the 1's digit of the number of rounds to play.
 X: Miscellaneous.
 XC(*): Holds the change in the ball's x-coordinate for each of the four directions.
 XP: Holds the ball's current x-coordinate.
 XT: Holds the x-coordinate of the next location to which the ball might go.
 Y: Miscellaneous.
 YC(*): Holds the change in the ball's y-coordinate for each of the four directions.
 YP: Holds the ball's current y-coordinate.
 YT: Holds the y-coordinate of the next position to which the ball might go.
 Z: Miscellaneous.
 ZZ: Holds the ATASCII value of location on screen during the end-of-round routine.

rebound

by Stephen Kuehne

Rebound is a two-player, abstract, arcade-style game for an Atari® with 16K RAM (24K with disk) and one or two joysticks.

Your joystick controls everything in *Rebound* — no need for the keyboard. If you have one joystick, plug it into port one; plug a second stick into port two. Use the joystick button to move past the instructions after you've read them. Then, move the stick up and down to select your responses to the set-up questions (one or two joysticks, skill levels, number of rounds to play). The button tells the Atari that you've made your choice.

The object of *Rebound* is to direct the moving ball into the colored goal at the center of the screen by placing diagonal barriers in the ball's path. You start play in each round by pressing the joystick button after the word "Serve" appears at the top of the screen. When you move your joystick left or right, a barrier appears. The type of barrier depends on the direction you move the stick. If you construct more than fifteen barriers, you can't receive any points, and if you use all your time, your opponent gets 25 bonus points. The amount of time you have depends on your skill level. A beeper warns when your time is almost up. If the ball goes into the goal and you've placed no barriers, it's a lucky serve, and you have to go again.

The game gets more complex as play progresses, because the barriers stay on the screen. Don't get too frustrated when you can't get the ball to go where you want — it's only a game.

Make a sound, then clear the kangaroo and the ball from the screen.

```

Variables

A\$: General input string.
 BALL%: Graphics array for ball.
 D(*): The kangaroo's change in position, according to the direction of movement.
 FL: A flag that determines whether to make sound.
 G: The number to add to the kangaroo's y-coordinate.
 IT: The shape number of the kangaroo.
 KANG1% — KANG4%: Graphics arrays for kangaroo.
 K,K2: ASCII values of input.
 L: The y-coordinate of the level.

M: The ball's horizontal coordinate.
 MO: Mode of operation — 1 for keyboard, 2 for joystick.
 P: Pause loop variable.
 Q: Level number.
 SHAPE\$(*): Kangaroo shapes.
 SP: Board number — controls speed of ball.
 T: Contains 0, 1, or 2, depending on the direction of movement.
 U: Number of kangaroos used.
 X, Y: Coordinates of the kangaroo.

KANGARILLA

by Oscar Bascara
Translation by Kerry Sheltine

Kangarilla is an arcade-style game for an IBM® PC with disk drive, 64K RAM and color graphics adapter. A joystick controller is optional.

In *Kangarilla*, you control a distraught mother kangaroo whose baby is stranded at the top of the four-level maze. To reach the upper levels, you must make the kangaroo leap through holes in the ceiling.

The program asks whether you wish to use the keyboard or a joystick. If you choose joystick control, move the joystick to control her direction, and use either button to make her jump. Be sure to press the button when the kangaroo's foot is on the ground. On the keyboard, use the cursor keypad: left-arrow for left, down-arrow to stop, right-arrow for right, and up-arrow to jump.

When you make the kangaroo leap, be careful not to make her bump into the ceiling, and watch out for the rolling ball that tries to trip her up. If she hits the ceiling or ball, the round is over, and you move to your next kangaroo.

If the kangaroo reaches her baby, the baby is suddenly transported away, but if you succeed six times, mother and baby live happily ever after. You will need good timing and a bit of strategy to accomplish this. Are you up to the *Kangarilla* challenge?

CRISIS

by Lyle Grant

Crisis is an arcade-style color graphics game for any Apple® II computer with one disk drive and 48K RAM.

A ruthless race of aliens has captured the Empire State Building, and holds the people inside as hostages. Your task is to rescue as many of the hostages as you can. You have three "men" to perform this feat of daring and bravery. The aliens have taken measures to prevent such a rescue. On each floor of the building, you encounter a poison cloud, an electric beam, and walls that suddenly appear in your path.

To free a hostage, you must touch him as you move about the floor. Use the I, J, K and M keys to move up, left, right and down. If you take too long to free a prisoner, he moves to another spot on the floor. Each time you free a hostage, you earn 100 points. If you save eight hostages without being killed, a door opens up on the left side of the screen. Going through the door gets you bonus points and a ride to the next floor. There you must rescue another eight, but the game gets progressively faster and harder.

Index

CRISIS by Lyle Grant..... **2**
A ruthless race of aliens has taken possession of the Empire State Building. Your goal is to rescue the hostages.

KANGARILLA by Oscar Bascara..... **7**
IBM® PC version by Kerry Sheltine
Your baby kangaroo has wandered to the top of a four-level maze, and you must rescue him.

REBOUND by Steven Kuehne..... **11**
Fire the moving ball into the colored goal in the center of your screen, but count the barriers you erect with each press of the joystick. They block or bounce your ball in the right direction — and lower your score as they accumulate.

**GENERAL INFORMATION
and SYSTEM REQUIREMENTS**..... **18**
