

- Member of the Texas Instruments *Widebus™* Family
- Independent Asynchronous Inputs and Outputs
- 1024 Words × 18 Bits
- Read and Write Operations Can Be Synchronized to Independent System Clocks
- Programmable Almost-Full/Almost-Empty Flag
- Input-Ready, Output-Ready, and Half-Full Flags
- Cascadable in Word Width and/or Word Depth
- Fast Access Times of 20 ns With a 50-pF Load
- High Output Drive for Direct Bus Interface
- Package Options Include 68-Pin Ceramic PGA (GB) or Space-Saving 68-Pin Ceramic Quad Flatpack (HV)†

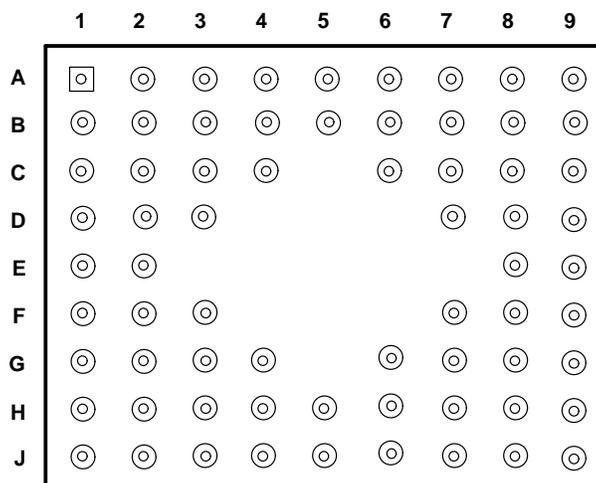

**description**

A FIFO memory is a storage device that allows data to be written into and read from its array at independent data rates. The SN54ACT7811 is a 1024 × 18-bit FIFO for high speed and fast access times. It processes data at rates up to 28.5 MHz and access times of 20 ns in a bit-parallel format. Data outputs are noninverting with respect to the data inputs. Expansion is easily accomplished in both word width and word depth.

The SN54ACT7811 has normal input-bus-to-output-bus asynchronous operation. The special enable circuitry adds the ability to synchronize independent read and write (interrupts, requests) to their respective system clock.

The SN54ACT7811 is characterized for operation from –55°C to 125°C.

## Terminal Functions

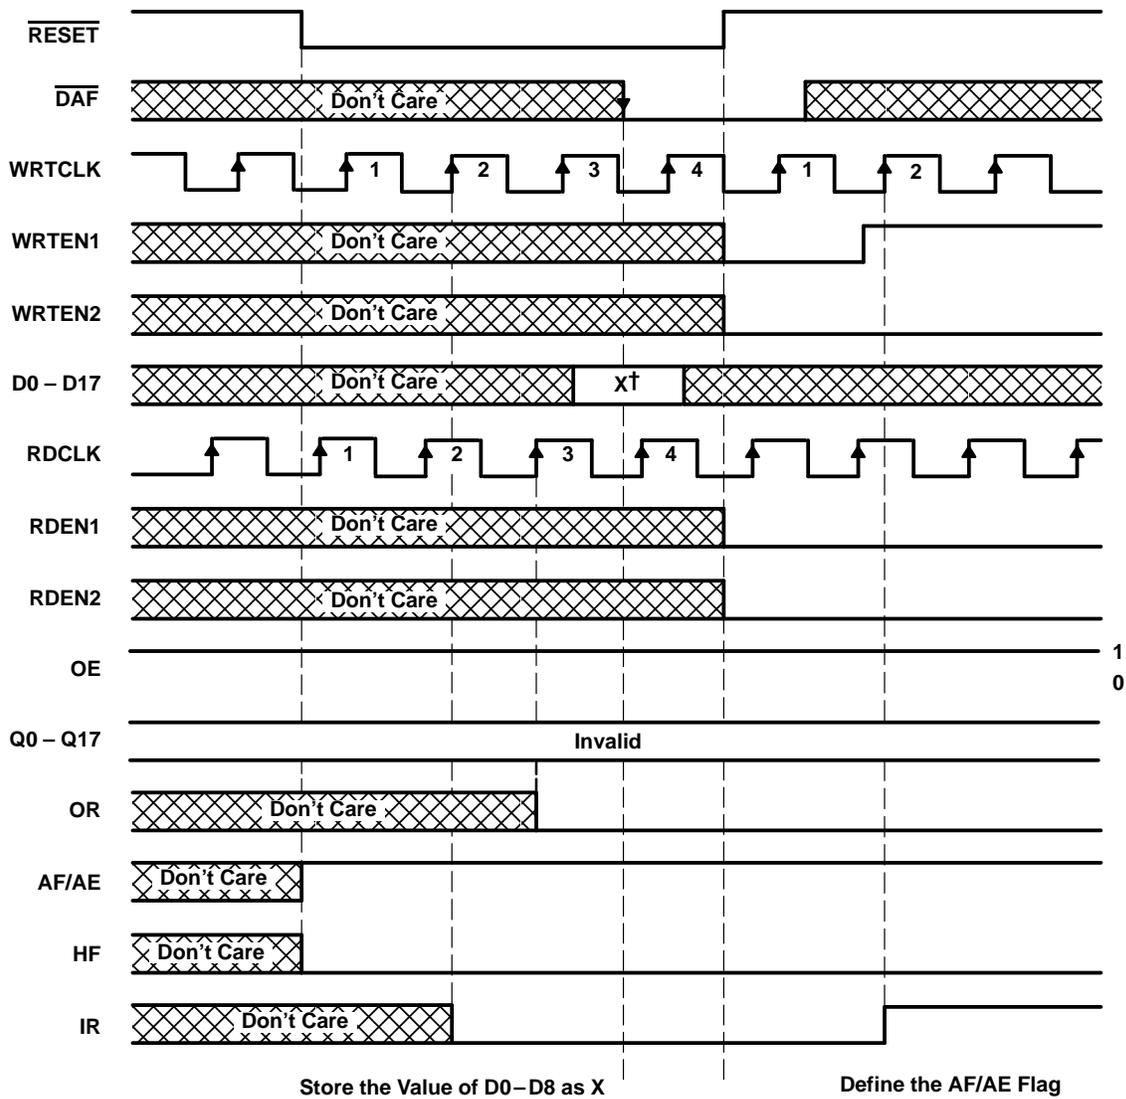

TERMINAL† NAME	NO.	I/O	DESCRIPTION
AF/AE	F9	O	<p>AF/AE boundary is defined by the AF/AE offset value (X). This value can be programmed during reset, or the default value of 256 can be used. The AF/AE flag is high when the FIFO contains (X + 1) or fewer words or (1025 - X) or more words. The AF/AE flag is low when the FIFO contains between (X + 2) and (1024 - X) words.</p> <p>Programming procedure for AF/AE – The AF/AE flag is programmed during each reset cycle. The AF/AE offset value (X) is either a user-defined value or the default of X = 256. Instructions to program AF/AE using both methods are as follows:</p> <p><u>User-defined X</u></p> <p>Step 1: Take <math>\overline{DAF}</math> from high to low.</p> <p>Step 2: If the reset (<math>\overline{RESET}</math>) input is not already low, take <math>\overline{RESET}</math> low.</p> <p>Step 3: With <math>\overline{DAF}</math> held low, take <math>\overline{RESET}</math> high. This defines the AF/AE flag using X.</p> <p>Step 4: To retain the current offset for the next reset, keep <math>\overline{DAF}</math> low.</p> <p><u>Default X</u></p> <p>To redefine the AF/AE flag using the default value of X = 256, hold <math>\overline{DAF}</math> high during the reset cycle.</p>
$\overline{DAF}$	H9	I	Define almost full. The high-to-low transition of $\overline{DAF}$ stores the binary value of data inputs as the AF/AE offset value (X). With $\overline{DAF}$ held low, a low pulse on the reset ( $\overline{RESET}$ ) input defines the AF/AE flag using X.
D0–D17	F2, G1, G2, H1–H4, H6–H8, J1–J3, J5–J9	I	Data inputs for 18-bit-wide data to be stored in the memory. Data lines D0–D8 also carry the AF/AE offset value (X) on a high-to-low transition of the $\overline{DAF}$ input.
HF	D9	O	Half-full flag. HF is high when the FIFO contains 513 or more words and is low when it contains 512 or fewer words.
IR	E9	O	Input-ready flag. IR is high when the FIFO is not full and low when the device is full. During reset, IR is driven low on the rising edge of the second write clock ( $\overline{WRTCLK}$ ) pulse. IR is then driven high on the rising edge of the second $\overline{WRTCLK}$ pulse after $\overline{RESET}$ goes high. After the FIFO is filled and IR is driven low, IR is driven high on the second $\overline{WRTCLK}$ pulse after the first valid read.
OE	D1	I	Output enable. The data-out (Q0–Q17) outputs are in the high-impedance state when OE is low. OE must be high before the rising edge of read clock (RDCLK) to read a word from memory.
OR	B1	O	Output ready flag. OR is high when the FIFO is not empty and low when it is empty. During reset, OR is set low on the rising edge of the third read clock (RDCLK) pulse. OR is set high on the rising edge of the third RDCLK pulse to occur after the first word is written into the FIFO. OR is set low on the rising edge of the first RDCLK pulse after the last word is read.
Q0–Q17	A1–A9, B2, B3, B5, B7–B9, C2, C8, C9	O	Data outputs. The first data word to be loaded into the FIFO is moved to the data-out (Q0–Q17) register on the rising edge of the third read clock (RDCLK) pulse to occur after the first valid write. The read-enable (RDEN1, RDEN2) inputs do not affect this operation. The following data is unloaded on the rising edge of RDCLK when RDEN1, RDEN2, OE, and OR are high.
RDCLK	F1	I	Read clock. Data is read out of memory on a low-to-high transition at RDCLK if the OR output and the OE, RDEN1, and RDEN2 control inputs are high. RDCLK is a free-running clock and functions as the synchronizing clock for all data transfers out of the FIFO. OR is also driven synchronously with respect to RDCLK.
RDEN1, RDEN2	E1 E2	I	Read enable. RDEN1 and RDEN2 must be high before a rising edge on RDCLK to read a word out of memory. The read enables are not used to read the first word stored in memory.
$\overline{RESET}$	C1	I	Reset. A reset is accomplished by taking $\overline{RESET}$ low and generating a minimum of four RDCLK and $\overline{WRTCLK}$ cycles. This ensures that the internal read and write pointers are reset and that OR, HF, and IR are low and AF/AE is high. The FIFO must be reset upon power up. With $\overline{DAF}$ input at a low level, a low pulse on $\overline{RESET}$ defines AF/AE using the AF/AE offset value (X), where X is the value previously stored. With $\overline{DAF}$ at a high level, a low-level pulse on $\overline{RESET}$ defines AF/AE using the default value of X = 256.

† Terminals listed are for the GB package.

**Terminal Functions (Continued)**

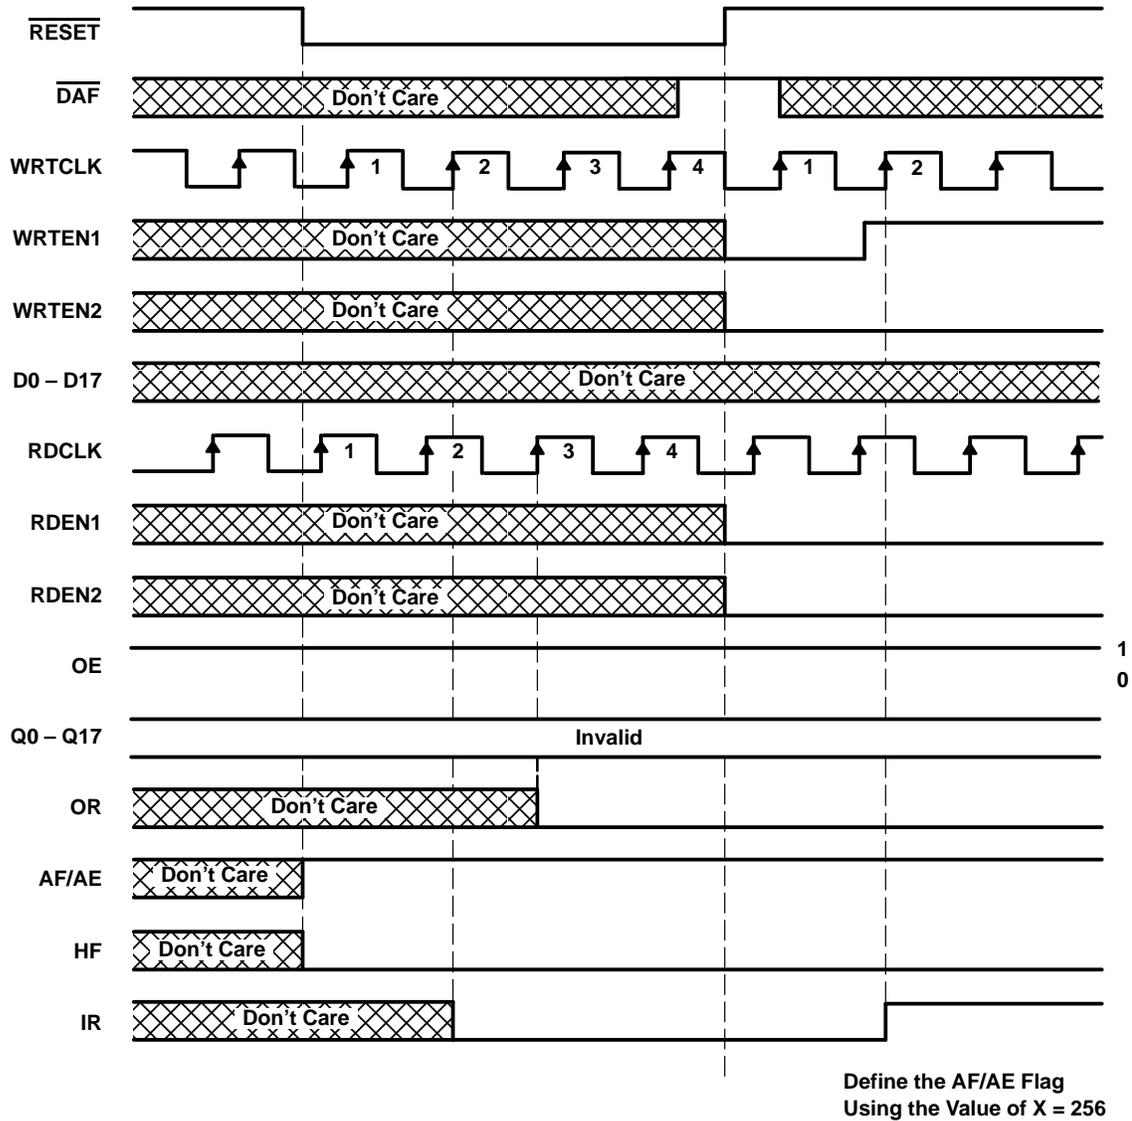

TERMINAL† NAME	NO.	I/O	DESCRIPTION
WRTCLK	G8	I	Write clock. Data is written into memory on a low-to-high transition of WRTCLK if the IR output and the WRTEN1 and WRTEN2 control inputs are high. WRTCLK is a free-running clock and functions as the synchronizing clock for all data transfers into the FIFO. IR output is also driven synchronously with respect to the WRTCLK signal.
WRTEN1, WRTEN2	G9 F8	I	Write enables. WRTEN1 and WRTEN2 must be high before a rising edge on WRTCLK for a word to be written into memory. The write enables do not affect the storage of the AF/AE offset value (X).

† Terminals listed are for the GB package.

† X is the binary value of D0–D8 only.

## calculating power dissipation

The maximum power dissipation ( $P_T$ ) of the SN54ACT7811 can be calculated by:

$$P_T = V_{CC} \times [I_{CC} + (N \times \Delta I_{CC} \times dc)] + \Sigma (C_{pd} \times V_{CC}^2 \times f_i) + \Sigma (C_L \times V_{CC}^2 \times f_o)$$

Where:

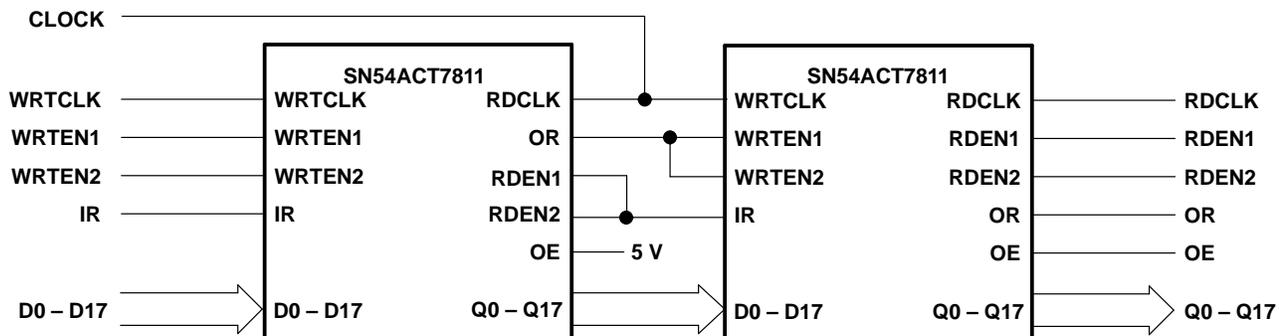

- $I_{CC}$  = power-down  $I_{CC}$  maximum
- $N$  = number of inputs driven by a TTL device
- $\Delta I_{CC}$  = increase in supply current
- $dc$  = duty cycle of inputs at a TTL high level of 3.4 V
- $C_{pd}$  = power dissipation capacitance
- $C_L$  = output capacitive load
- $f_i$  = data input frequency
- $f_o$  = data output frequency

**APPLICATION INFORMATION**

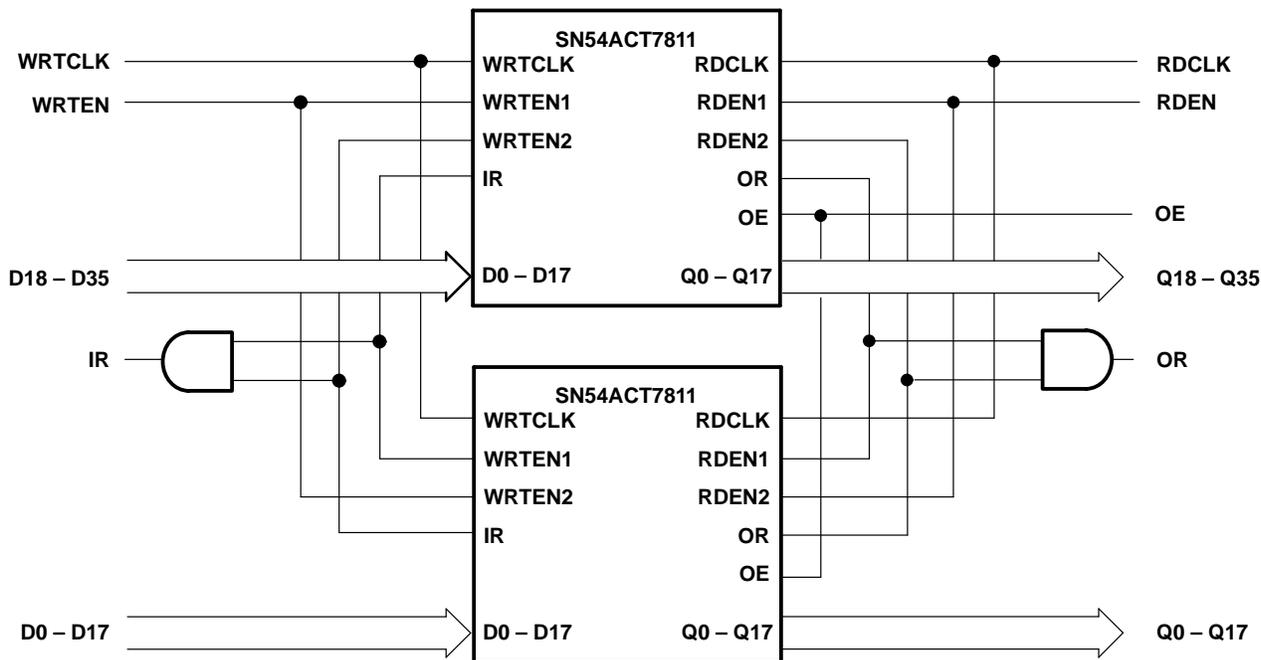

**expanding the SN54ACT7811**

The SN54ACT7811 is expandable in width and depth. Expanding in word depth offers special timing considerations:

- After the first data word is loaded into the FIFO, the word is unloaded, and the OR output goes high after  $(N \times 3)$  RDCLK cycles, where N is the number of devices used in depth expansion.
- After the FIFO is filled, the IR output goes low, the first word is unloaded, and the IR is driven high after  $(N \times 2)$  write clock cycles, where N is the number of devices used in depth expansion.

**Figure 7. Word-Depth Expansion: 2048 Words × 18 Bits, N = 2**

**Figure 8. Word-Width Expansion: 1024 Words × 36 Bits**

## **IMPORTANT NOTICE**

Texas Instruments (TI) reserves the right to make changes to its products or to discontinue any semiconductor product or service without notice, and advises its customers to obtain the latest version of relevant information to verify, before placing orders, that the information being relied on is current.

TI warrants performance of its semiconductor products and related software to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Certain applications using semiconductor products may involve potential risks of death, personal injury, or severe property or environmental damage ("Critical Applications").

**TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, INTENDED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT APPLICATIONS, DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS.**

Inclusion of TI products in such applications is understood to be fully at the risk of the customer. Use of TI products in such applications requires the written approval of an appropriate TI officer. Questions concerning potential risk applications should be directed to TI through a local SC sales office.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards should be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein. Nor does TI warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used.
